1 Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance.

Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners.

There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

1.1 Description

ARC 600 processor model (ARCV1 architecture)

1.2 Licensing

Usage of binary model under license governing simulator usage. Source of model available under Imperas Software License Agreement.

1.3 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately.

Instruction and data caches are not modeled, except for the auxiliary register interface.

External host debug is not modeled, except for the auxiliary register interface.

Real-world timing effects are not modeled. All instructions are assumed to complete in a single cycle.

User extensions are not yet implemented, except for extension core registers.

1.4 Verification

Models have been validated correct in a cooperative project between Imperas and ARC

1.5 Reference

ARC Processor ARC6xx/ARC7xx Reference Documentation

1.6 Debugging

The model has been designed for debug using GNU gdb ARCompact/ARCV2 ISA elf32 version 7.5.1. To ensure correct behavior, enter the following command into gdb before attempting to connect to the processor:

```
set architecture ARC600
```

Failure to do this may cause the debugging session to fail because of g-packet size mismatch.

1.7 Features

The model implements the full ARCV1 instruction set.

The model can be configured with either a 16-entry or 32-entry register file using parameter `opt-rf16`.

The exact set of core instructions present can be configured by a number of parameters: see information for `opt-swap`, `opt-bitscan`, `opt-extended-arith` and `opt-multiply` in the table below.

Parameter `opt-extension-interrupts` can be used to enable extension interrupts 16-31.

Timer 0 and Timer 1 can be enabled using parameters `opt-timer0` and `opt-timer1`, respectively.

The versions of DCCM and ICCM build config registers can be specified using parameters `opt-dccm-version` and `opt-iccm-version`, respectively. The sizes of DCCM, ICCM0 and ICCM1 can be specified using parameters `opt-dccm-size`, `opt-iccm0-size` and `opt-iccm1-size`, respectively. Reset base addresses for the ICCMs can be specified using `opt-iccm0-base` and `opt-iccm1-base`. Note that the DCCM reset base address is architecturally defined (0x80000000) and not configurable. When CCMs are present, bus ports called DCCM0, ICCM0 and ICCM1 are created so that CCM contents may be viewed or modified externally by connecting to these ports. Parameter `opt-internal-ccms` specifies whether CCM memory is modeled internally or externally. If modeled externally, the CCMs must be implemented on a bus which is then connected to the CCM bus ports listed above (this parameter is ignored if CCM ports are unconnected; in that case, CCMs are always modeled internally). Parameter `opt-reset-internal-ccms` indicates that internally-modeled CCMs should be cleared to zero on a processor reset; if False, then internally-modeled CCMs retain their previous state after a reset.

The set of core registers can be specified using parameter `opt-extension-core-regs`. This is a 64-bit value in which a 1-bit implies the presence of that core extension register. For example, a value of 0xf0000000ULL implies that extension registers r32-r35 should be configured.

The reset value of the exception vector base register can be specified using parameter `opt-intvbase-preset`.

2 Configuration

2.1 Location

The model source and object file is found in the VLNV tree at:

arc.ovpworld.org/processor/arc/1.0

2.2 GDB Path

The default GDB for this model is found at:

`$IMPERAS_HOME/lib/$IMPERAS_ARCH/gdb/arc-elf32-gdb`

2.3 Semi-Host Library

The default semi-host library file is found in the VLNV tree at :

arc.ovpworld.org/semihosting/arcNewlib/1.0

2.4 Processor Endian-ness

This model can be set to either endian-ness (normally by a pin, or the ELF code).

2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

2.6 Processor ELF Code

The ELF code supported by this model is: 0x5d

3 Other Variants in this Model

Table 1. All variants in this model

Variant
600
605
700
0x21
0x22
0x31
0x32

4 Bus Ports

Table 2. Bus Ports

Type	Name	min	max
master (initiator)	INSTRUCTION	32	32
master (initiator)	DATA	32	32

5 Net Ports

Table 3. Net Ports

Name	Type	Description
reset	input	Processor reset
watchdog	output	Watchdog timer
irq4	input	External interrupt
irq5	input	External interrupt
irq6	input	External interrupt
irq8	input	External interrupt
irq9	input	External interrupt
irq10	input	External interrupt
irq11	input	External interrupt
irq12	input	External interrupt
irq13	input	External interrupt
irq14	input	External interrupt
irq15	input	External interrupt

6 FIFO Ports

No FIFO Ports in this model.

7 Parameters

Table 4. Parameters that can be set in the model, type:

Name	Type	Description
verbose	Boolean	Enable verbose messages
end-on-halt	Boolean	Specify whether to end simulation when halt bit set in STATUS/STATUS32
dump-bcrs	Boolean	Add BCRs to register trace
format	Enumeration	Select register format gdb=0 metaware=1
compatibility	Enumeration	Select compatibility mode ISA=0 metaware8.2=1
opt-identity	Uns32	Override value of IDENTITY register
opt-intvbase-preset	Uns32	Specify reset vector base register x 1024 (VECBASE_AC_BUILD.Addr)
opt-rf16	Uns32	Specify 16-entry core register file (RF_BUILD.E)
opt-swap	Uns32	Specify swap instructions version (SWAP_BUILD.Version)
opt-bitscan	Uns32	Specify bitscan instructions version (NORM_BUILD.Version)
opt-extended-arith	Uns32	Specify extended arithmetic version (EA_BUILD.Version)
opt-multiply	Uns32	Specify multiply instructions version (MULTIPLY_BUILD.Version)
opt-extension-interrupts	Uns32	Enable extension interrupts 16-31
opt-timer0	Uns32	Timer 0 present (TIMER_BUILD.T0)
opt-timer1	Uns32	Timer 1 present (TIMER_BUILD.T1)
opt-dccm-version	Uns32	Specify DCCM RAM version (DCCM_BUILD.Version)
opt-dccm-size	Uns32	Specify DCCM RAM size (DCCM_BUILD.Size)
opt-iccm-version	Uns32	Specify ICCM RAM version (ICCM_BUILD.Version)
opt-iccm0-size	Uns32	Specify ICCM0 RAM size (ICCM_BUILD.ICCM0_SIZE)
opt-iccm1-size	Uns32	Specify ICCM1 RAM size (ICCM_BUILD.ICCM1_SIZE)
opt-iccm0-base	Uns32	Specify ICCM0 RAM base address at reset
opt-iccm1-base	Uns32	Specify ICCM1 RAM base address at reset
opt-internal-ccms	Boolean	Specify that configured CCMs should be modeled internally
opt-reset-internal-ccms	Boolean	Specify that internally-modeled configured CCMs should be zeroed at reset
opt-ccm-wrap	Boolean	Specify that CCMs should wrap to fill 1/16th of memory space
opt-extension-core-regs	Uns64	Bitmask specifying extension core registers

8 Execution Modes

Table 5. CPU modes implemented in the model, type:

Name	Code	Description
Kernel	0	Kernel mode

9 Exceptions

Table 6. Exceptions handled by the model, type:

Name	Code
Reset	0
IllegalInstruction	2
MisalignedDataAccess	28
Interrupt	29

10 Hierarchy of the model

A CPU core may allow the user to configure it to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy.

Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

10.1 Level 1:

This level in the model hierarchy has 2 commands.

This level in the model hierarchy has 3 register groups:

Table 7. Register groups

Group name	Registers
core.arcompact	18
aux-minimal	20
BCR	28

This level in the model hierarchy has no children.

11 Model Commands

11.1 Level 1:

11.1.1 *isync*

specify instruction address range for synchronous execution

Table 8. *isync* command arguments

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

11.1.2 *itrace*

enable or disable instruction tracing

Table 9. *itrace* command arguments

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-instructioncount	Boolean	include the instruction number in each trace
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

12 Registers

12.1 Level 1:

12.1.1 *core.arcompact*

Table 10. Registers at level 1, type: , register group: 'core.arcompact'

Name	Bits	Initial value (Hex)		Description
R0	32	0	rw	
R1	32	0	rw	
R2	32	0	rw	
R3	32	0	rw	
R10	32	0	rw	
R11	32	0	rw	
R12	32	0	rw	
R13	32	0	rw	

R14	32	0	rw	
R15	32	0	rw	
GP	32	0	rw	
FP	32	0	rw	frame pointer
SP	32	4000	rw	stack pointer
ILINK1	32	0	rw	
ILINK2	32	0	rw	
BLINK	32	0	rw	
LP_COUNT	32	0	r-	
PCL	32	0	r-	

12.1.2 aux-minimal

Table 11. Registers at level 1, type: , register group: 'aux-minimal'

Name	Bits	Initial value (Hex)		Description
STATUS	32	0	r-	0x000: Status (Obsolete)
SEMAPHORE	32	0	rw	0x001: Semaphore
LP_START	32	0	rw	0x002: Loop Start
LP_END	32	0	rw	0x003: Loop End
IDENTITY	32	21	r-	0x004: Identity
DEBUG	32	0	rw	0x005: Debug
PC	32	0	rw	0x006: Program Counter
STATUS32	32	0	r-	0x00a: 32-bit Status
STATUS32_L1	32	0	rw	0x00b: L1 Interrupt Status
STATUS32_L2	32	0	rw	0x00c: P0 Interrupt Status
COUNT0	32	0	rw	0x021: Timer 0 Count Value
CONTROL0	32	0	rw	0x022: Timer 0 Control
LIMIT0	32	ffffff	rw	0x023: Timer 0 Limit
INT_VECTOR_BASE	32	0	rw	0x025: Interrupt Vector Base
AUX_IRQ_LV12	32	0	rw	0x043: L1/L2 Interrupt Level
COUNT1	32	0	rw	0x100: Timer 1 Count Value
CONTROL1	32	0	rw	0x101: Timer 1 Control
LIMIT1	32	ffffff	rw	0x102: Timer 1 Limit
AUX_IRQ_LEV	32	c0	rw	0x200: Interrupt Level Programming
AUX_IRQ_HINT	32	0	rw	0x201: Software Interrupt Trigger

12.1.3 BCR

Table 12. Registers at level 1, type: , register group: 'BCR'

Name	Bits	Initial value (Hex)	Description
------	------	---------------------	-------------

BCR_VER	32	1	r-	0x060: Configuration Register Version
BCR_DCCM_BASE	32	0	r-	0x061: DCCM Base Address
BCR_CRC	32	0	r-	0x062: CRC Configuration
BCR_VBFDW	32	0	r-	0x064: VBFDW Configuration
BCR_EA_BUILD	32	0	r-	0x065: EA Configuration
BCR_DATASPACE	32	0	r-	0x066: DataSpace Configuration
BCR_MEMSUBSYS	32	1	r-	0x067: Memory Subsystem Configuration
BCR_VECBASE_AC_BUILD	32	0	r-	0x068: Interrupt Vector Base Address Configuration
BCR_PBASEADDR	32	0	r-	0x069: PBASE Configuration
BCR_MPU_BUILD	32	0	r-	0x06d: MPU Configuration
BCR_RF_BUILD	32	201	r-	0x06e: Core Register Set Configuration
BCR_VECBASE_BUILD	32	0	r-	0x071: VECBASE Configuration
