Chapter 1

Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

1.1 Description

RISC-V NX25F 64-bit processor model

1.2 Licensing

This Model is released under the Open Source Apache 2.0

1.3 Extensions

1.3.1 Extensions Enabled by Default

The model has the following architectural extensions enabled, and the following bits in the `misa` CSR Extensions field will be set upon reset:

- `misa` bit 0: extension A (atomic instructions)
- `misa` bit 2: extension C (compressed instructions)
- `misa` bit 3: extension D (double-precision floating point)
- `misa` bit 5: extension F (single-precision floating point)
- `misa` bit 8: RV32I/RV64I/RV128I base integer instruction set
- `misa` bit 12: extension M (integer multiply/divide instructions)
- `misa` bit 20: extension U (User mode)
- `misa` bit 23: extension X (non-standard extensions present)

To specify features that can be dynamically enabled or disabled by writes to the `misa` register in addition to those listed above, use parameter “`add_Extensions_mask`”. This is a string parameter containing the feature letters to add; for example, value “DV” indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the `misa` register, if supported on this variant.

Legacy parameter “`misa_Extensions_mask`” can also be used. This `Uns32`-valued parameter specifies all writable bits in the `misa` Extensions field, replacing any permitted bits defined in the base variant.

Note that any features that are indicated as present in the `misa` mask but absent in the `misa` will be ignored. See the next section.

1.3.2 Available Extensions Not Enabled by Default

The following extensions are supported by the model, but not enabled by default in this variant:

- `misa` bit 1: extension B (bit manipulation extension)
- `misa` bit 4: RV32E base integer instruction set (embedded)
- `misa` bit 7: extension H (hypervisor)
- `misa` bit 10: extension K (cryptographic)
- `misa` bit 13: extension N (user-level interrupts)
- `misa` bit 18: extension S (Supervisor mode)
- `misa` bit 21: extension V (vector extension)

To add features from this list to the base variant, use parameter “`add_Extensions`”. This is a string parameter containing the feature letters to add; for example, value “DV” indicates that double-precision floating point and the Vector Extension should be enabled, if they are currently absent

and are available on this variant.

Legacy parameter “misa_Extensions” can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any permitted bits defined in the base variant.

1.4 General Features

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter “mtvec_is_ro”.

Values written to “mtvec” are masked using the value 0xffffffffffffd. A different mask of writable bits may be specified using parameter “mtvec_mask” if required. In addition, when Vectored interrupt mode is enabled, parameter “tvec_align” may be used to specify additional hardware-enforced base address alignment. In this variant, “tvec_align” defaults to 0, implying no alignment constraint.

The initial value of “mtvec” is 0x0. A different value may be specified using parameter “mtvec” if required.

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter “reset_address” or applied using optional input port “reset_addr” if required.

On an NMI, the model will restart at address 0x0. A different NMI address may be specified using parameter “nmi_address” or applied using optional input port “nmi_addr” if required.

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP using parameter “wfi_is_nop”. WFI timeout wait is implemented with a time limit of 0 (i.e. WFI causes an Illegal Instruction trap in Supervisor mode when mstatus.TW=1).

The “cycle” CSR is implemented in this variant. Set parameter “cycle_undefined” to True to instead specify that “cycle” is unimplemented and reads of it should trap to Machine mode.

The “time” CSR is implemented in this variant. Set parameter “time_undefined” to True to instead specify that “time” is unimplemented and reads of it should trap to Machine mode. Usually, the value of the “time” CSR should be provided by the platform - see notes below about the artifact “CSR” bus for information about how this is done.

The “instret” CSR is implemented in this variant. Set parameter “instret_undefined” to True to instead specify that “instret” is unimplemented and reads of it should trap to Machine mode.

Unaligned memory accesses are not supported by this variant. Set parameter “unaligned” to “T” to enable such accesses.

Unaligned memory accesses are not supported for AMO instructions by this variant. Set parameter “unalignedAMO” to “T” to enable such accesses.

A PMP unit is not implemented by this variant. Set parameter “PMP_registers” to indicate that the unit should be implemented with that number of PMP entries.

LR/SC instructions are implemented with a 1-byte reservation granule. A different granule size may be specified using parameter “lr_sc_grain”.

1.5 Floating Point Features

The D extension is enabled in this variant independently of the F extension. Set parameter “d_requires.f” to “T” to specify that the D extension requires the F extension to be enabled.

Half precision floating point is not implemented. Use parameter “Zfh” to enable this if required.

By default, the processor starts with floating-point instructions disabled (mstatus.FS=0). Use parameter “mstatus_FS” to force mstatus.FS to a non-zero value for floating-point to be enabled from the start.

The specification is imprecise regarding the conditions under which mstatus.FS is set to Dirty state (3). Parameter “mstatus_fs_mode” can be used to specify the required behavior in this model, as described below.

If “mstatus_fs_mode” is set to “always_dirty” then the model implements a simplified floating point status view in which mstatus.FS holds values 0 (Off) and 3 (Dirty) only; any write of values 1 (Initial) or 2 (Clean) from privileged code behave as if value 3 was written.

If “mstatus_fs_mode” is set to “write_1” then mstatus.FS will be set to 3 (Dirty) by any explicit write to the fflags, frm or fcsr control registers, or by any executed instruction that writes an FPR, or by any executed floating point compare or conversion to integer/unsigned that signals a floating point exception. Floating point compare or conversion to integer/unsigned instructions that do not signal an exception will not set mstatus.FS.

If “mstatus_fs_mode” is set to “write_any” then mstatus.FS will be set to 3 (Dirty) by any explicit write to the fflags, frm or fcsr control registers, or by any executed instruction that writes an FPR, or by any executed floating point compare or conversion even if those instructions do not signal a floating point exception.

In this variant, “mstatus_fs_mode” is set to “write_1”.

1.6 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter “CLICLEVELS”; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification, and further parameters are made available to configure other aspects of the CLIC. “CLICLEVELS” is zero in this variant, indicating that a CLIC is not implemented.

1.7 Load-Reserved/Store-Conditional Locking

By default, LR/SC locking is implemented automatically by the model and simulator, with a reservation granule defined by the “lr_sc_grain” parameter. It is also possible to implement locking externally to the model in a platform component, using the “LR_address”, “SC_address” and “SC_valid” net ports, as described below.

The “LR_address” output net port is written by the model with the address used by a load-

reserved instruction as it executes. This port should be connected as an input to the external lock management component, which should record the address, and also that an LR/SC transaction is active.

The “SC_address” output net port is written by the model with the address used by a store-conditional instruction as it executes. This should be connected as an input to the external lock management component, which should compare the address with the previously-recorded load-reserved address, and determine from this (and other implementation-specific constraints) whether the store should succeed. It should then immediately write the Boolean success/fail code to the “SC_valid” input net port of the model. Finally, it should update state to indicate that an LR/SC transaction is no longer active.

It is also possible to write zero to the “SC_valid” input net port at any time outside the context of a store-conditional instruction, which will mark any active LR/SC transaction as invalid.

Irrespective of whether LR/SC locking is implemented internally or externally, taking any exception or interrupt or executing exception-return instructions (e.g. MRET) will always mark any active LR/SC transaction as invalid.

1.8 Active Atomic Operation Indication

The “AMO_active” output net port is written by the model with a code indicating any current atomic memory operation while the instruction is active. The written codes are:

- 0: no atomic instruction active
- 1: AMOMIN active
- 2: AMOMAX active
- 3: AMOMINU active
- 4: AMOMAXU active
- 5: AMOADD active
- 6: AMOXOR active
- 7: AMOOR active
- 8: AMOAND active
- 9: AMOSWAP active
- 10: LR active
- 11: SC active

1.9 Interrupts

The “reset” port is an active-high reset input. The processor is halted when “reset” goes high and resumes execution from the reset address specified using the “reset_address” parameter or

“reset_addr” port when the signal goes low. The “mcause” register is cleared to zero.

The “nmi” port is an active-high NMI input. The processor resumes execution from the address specified using the “nmi_address” parameter or “nmi_addr” port when the NMI signal goes high. The “mcause” register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called “MSWInterrupt”, “MTimerInterrupt” and “MExternalInterrupt”, respectively. When the N extension is implemented, ports are also present for User mode. Parameter “unimp_int_mask” allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the “mip” CSR; any interrupt corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in “mip”, “mie” and “mideleg” CSRs (and Supervisor and User mode equivalents if implemented).

Parameter “external_int_id” can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is applied the value on the ID port is sampled and used to fill the Exception Code field in the “mcause” CSR (or the equivalent CSR for other execution levels). For Machine mode, the extra interrupt ID port is called “MExternalInterruptID”.

The “deferint” port is an active-high artifact input that, when written to 1, prevents any pending-and-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

1.10 Debug Mode

The model can be configured to implement Debug mode using parameter “debug_mode”. This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter “debug_version” (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter “debug_mode” can be used to specify three different behaviors, as follows:

1. If set to value “vector”, then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the “debug_address” parameter. It will execute at this address, in Debug mode, until a “dret” instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the “dexc_address” parameter.
2. If set to value “interrupt”, then operations that would cause entry to Debug mode result in the processor simulation call (e.g. `opProcessorSimulate`) returning, with a stop reason of `OP_SR_INTERRUPT`. In this usage scenario, the Debug Module is implemented in the simulation harness.
3. If set to value “halt”, then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of `OP_SR_HALT`, or debug mode might be implemented by

another platform component which then restarts the debugged processor again.

1.10.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, “DM”. When “DM” is True, the processor is in Debug mode. When “DM” is False, mode is defined by “mstatus” in the usual way.

Entry to Debug mode can be performed in any of these ways:

1. By writing True to register “DM” (e.g. using `opProcessorRegWrite`) followed by simulation of at least one cycle (e.g. using `opProcessorSimulate`), `dcsr` cause will be reported as trigger;
2. By writing a 1 then 0 to net “haltreq” (using `opNetWrite`) followed by simulation of at least one cycle (e.g. using `opProcessorSimulate`);
3. By writing a 1 to net “resethaltreq” (using `opNetWrite`) while the “reset” signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using `opProcessorSimulate`);
4. By executing an “ebreak” instruction when Debug mode entry for the current processor mode is enabled by `dcsr.ebreakm`, `dcsr.ebreaks` or `dcsr.ebreaku`.

In all cases, the processor will save required state in “dpc” and “dcsr” and then perform actions described above, depending in the value of the “debug_mode” parameter.

1.10.2 Debug State Exit

Exit from Debug mode can be performed in any of these ways:

1. By writing False to register “DM” (e.g. using `opProcessorRegWrite`) followed by simulation of at least one cycle (e.g. using `opProcessorSimulate`);
2. By executing an “dret” instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

1.10.3 Debug Registers

When Debug mode is enabled, registers “dcsr”, “dpc”, “dscratch0” and “dscratch1” are implemented as described in the specification. These may be manipulated externally by a Debug Module using `opProcessorRegRead` or `opProcessorRegWrite`; for example, the Debug Module could write “dcsr” to enable “ebreak” instruction behavior as described above, or read and write “dpc” to emulate stepping over an “ebreak” instruction prior to resumption from Debug mode.

1.10.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

1. Write the address of a Program Buffer to the program counter using `opProcessorPCSet`;
2. If “`debug_mode`” is set to “`halt`”, write 0 to pseudo-register “`DMStall`” (to leave halted state);
3. If entry to Debug mode was handled by exiting the simulation callback, call `opProcessorSimulate` or `opRootModuleSimulate` to resume simulation.

Debug mode will be re-entered in these cases:

1. By execution of an “`ebreak`” instruction; or:
2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with `stopReason` of `OP_SR_INTERRUPT`, or perform a halt, depending on the value of the “`debug_mode`” parameter.

1.10.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting `dcsr.step`. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until `dcsr.step` is cleared.

1.10.6 Debug Ports

Port “`DM`” is an output signal that indicates whether the processor is in Debug mode

Port “`haltreq`” is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port “`resethaltreq`” is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

1.11 Trigger Module

This model is configured with a trigger module, implementing a subset of the behavior described in Chapter 5 of the RISC-V External Debug Support specification with version specified by parameter “`debug_version`” (see References).

1.11.1 Trigger Module Restrictions

The model currently supports `tdata1` of type 0, type 2 (`mcontrol`), type 3 (`icount`), type 4 (`itrigger`), type 5 (`etrigger`) and type 6 (`mcontrol6`). `icount` triggers are implemented for a single instruction only, with count hard-wired to 1 and automatic zeroing of mode bits when the trigger fires.

1.11.2 Trigger Module Parameters

Parameter “trigger_num” is used to specify the number of implemented triggers. In this variant, “trigger_num” is 4.

Parameter “tinfo” is used to specify the value of the read-only “tinfo” register, which indicates the trigger types supported. In this variant, “tinfo” is 0x3d.

Parameter “tinfo_undefined” is used to specify whether the “tinfo” register is undefined, in which case reads of it trap to Machine mode. In this variant, “tinfo_undefined” is 0.

Parameter “tcontrol_undefined” is used to specify whether the “tcontrol” register is undefined, in which case accesses to it trap to Machine mode. In this variant, “tcontrol_undefined” is 0.

Parameter “mcontext_undefined” is used to specify whether the “mcontext” register is undefined, in which case accesses to it trap to Machine mode. In this variant, “mcontext_undefined” is 0.

Parameter “scontext_undefined” is used to specify whether the “scontext” register is undefined, in which case accesses to it trap to Machine mode. In this variant, “scontext_undefined” is 0.

Parameter “amo_trigger” is used to specify whether load/store triggers are activated for AMO instructions. In this variant, “amo_trigger” is 0.

Parameter “no_hit” is used to specify whether the “hit” bit in tdata1 is unimplemented. In this variant, “no_hit” is 0.

Parameter “mcontext_bits” is used to specify the number of writable bits in the “mcontext” register. In this variant, “mcontext_bits” is 13.

Parameter “mvalue_bits” is used to specify the number of writable bits in the “mvalue” field in “textra32”/“textra64” registers; if zero, the “mselect” field is tied to zero. In this variant, “mvalue_bits” is 13.

Parameter “mcontrol_maskmax” is used to specify the value of field “maskmax” in the “mcontrol” register. In this variant, “mcontrol_maskmax” is 63.

1.12 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the “override_debugMask” parameter, or dynamically using the “debugflags” command. Enabled messages are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state.

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

1.13 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

1.13.1 CSR Register External Implementation

If parameter “enable_CSR_bus” is True, an artifact 16-bit bus “CSR” is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use `opBusSlaveNew` or `icmMapExternalMemory`, depending on the client API). A CSR with index `0xABC` is mapped on the bus at address `0xABC0`; as a concrete example, implementing CSR “time” (number `0xC01`) externally requires installation of callbacks at address `0xC010` on the CSR bus.

1.13.2 LR/SC Active Address

Artifact register “LRSCAddress” shows the active LR/SC lock address. The register holds all-ones if there is no LR/SC operation active or if LR/SC locking is implemented externally as described above.

1.14 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. `fence.i`) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. `fence`) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

Andes-specific cache, local memory and ECC behavior is not yet implemented, except for CSR state.

Andes Performance and Code Dense instructions and associated CSR state are implemented, but the EXEC.IT instruction supports in-memory table mode using the `uitb` CSR only (not hardwired mode).

PMP and PMA accesses that any-byte match but do not all-byte match are broken into separate smaller accesses that follow all-byte match rules.

1.15 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from <https://github.com/riscv/riscv-tests>.

Also reference tests have been used from various sources including:

<https://github.com/riscv/riscv-tests>

<https://github.com/ucb-bar/riscv-torture>

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

<https://github.com/riscv/riscv-compliance>

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

<http://valtrix.in/sting> from Valtrix

<https://github.com/google/riscv-dv> from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

1.16 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 2.2)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version 1.10)

— AndesCore_NX25_DS131_V1.0 DS131-10

— AndeStar V5 Architecture and CSR Definitions (UM164-1515, 2020-05-08)

Chapter 2

Andes-Specific Extensions

Andes processors add various custom extensions to the basic RISC-V architecture. This model implements the following:

- 1: Hardware Stack Protection (if `mmisc_cfg.HSP=1`);
- 2: Physical Memory Attribute Unit (if `mmisc_cfg.DPMA=1`).
- 3: Performance Throttling (register interface only, if `mmisc_cfg.PFT=1`);
- 4: CSRs for CCTL Operations (register interface only, if `mmisc_cfg.CCTLCSR=1`);
- 5: Performance Extension instructions (if `mmisc_cfg.EV5MPE=1`);
- 6: CodeDense instructions (if `mmisc_cfg.ECD=1`);
- 7: Half-precision load/store instructions (if `mmisc_cfg.EFHW=1`).
- 8: BFLOAT16 conversion instructions (if `mmisc_cfg.BFLOAT16=1`).
- 9: Half-precision arithmetic instructions (if `mmisc_cfg.ZFH=1`).
- 10: Vector INT4 load extension (if `mmisc_cfg.VL4=1`).

Other Andes-specific extensions are not currently modeled. The exact set of supported extensions can be configured using parameter “`andesExtensions/mmisc_cfg`”, which overrides the default value of the `mmisc_cfg` register (see detailed description below).

2.1 Andes-Specific Parameters

In addition to the base model RISC-V parameters, this model implements parameters allowing Andes-specific model features to be controlled. These parameters are documented below.

2.1.1 Parameter `andesExtensions/mmisc_cfg`

This parameter allows the value of the read-only `mmisc_cfg` register to be specified. Bits that affect behavior of the model are:

bit 3 (ECD): enables CodeDense instructions and uitb CSR.

bit 4 (PFT): determines presence of mpft_ctl register and affects implemented fields in mxstatus.

bit 5 (HSP): enables HW Stack protection, relevant CSRs and affects implemented fields in mxstatus.

bit 13 (EV5PE): enables Performance Extension support.

bit 15 (PMNDS): enables Andes-enhanced Performance Monitoring.

bit 16 (CCTLCSR): enables CCTL CSRs.

bit 30 (DPMA): enables the Physical Memory Attribute Unit and relevant CSRs.

bit 32 (BF16CVT): enables BFLOAT16 conversion extension.

bit 33 (ZFH): enables FP16 half-precision extension.

bit 34 (VL4): enables vector INT4 load extension.

Other bits can be set or cleared but do not affect model behavior.

Example: `-override iss/cpu0/andesExtensions/mmsc_cfg=0x2028`

2.1.2 Parameter `andesExtensions/micm_cfg`

This parameter allows the value of the read-only `micm_cfg` register to be specified. Bits that affect behavior of the model are:

bits 8:6 (ISZ): enables `mcache_ctl` CSR if non-zero.

bits 14:12 (ILMB): enables `milmb` CSR if non-zero.

Other bits can be set or cleared but do not affect model behavior, except that if any bit is non zero then IME/PIME bits in `mxstatus` are modeled.

Example: `-override iss/cpu0/andesExtensions/micm_cfg=0`

2.1.3 Parameter `andesExtensions/mdcm_cfg`

This parameter allows the value of the read-only `mdcm_cfg` register to be specified. Bits that affect behavior of the model are:

bits 8:6 (DSZ): enables `mcache_ctl` CSR if non-zero.

bits 14:12 (DLMB): enables `mdlmb` CSR if non-zero.

Other bits can be set or cleared but do not affect model behavior, except that if any bit is non zero then DME/DIME bits in `mxstatus` are modeled.

Example: `-override iss/cpu0/andesExtensions/mdcm_cfg=0`

2.1.4 Parameter `andesExtensions/uitb`

This parameter allows the value of the `uitb` register to be specified.

Example: `-override iss/cpu0/andesExtensions/uitb=0`

2.1.5 Parameter `andesExtensions/milmb`

This parameter allows the value of the `milmb` register to be specified.

Example: `-override iss/cpu0/andesExtensions/milmb=0`

2.1.6 Parameter `andesExtensions/milmbMask`

This parameter allows the mask of writable bits in the `milmb` register to be specified. The default value for this variant is `0xe` (`RWECC` and `ECCEN` are writable, all other bits are read-only).

Example: `-override iss/cpu0/andesExtensions/milmbMask=0xe`

2.1.7 Parameter `andesExtensions/mdlmb`

This parameter allows the value of the `mdlmb` register to be specified.

Example: `-override iss/cpu0/andesExtensions/mdlmb=0`

2.1.8 Parameter `andesExtensions/mdlmbMask`

This parameter allows the mask of writable bits in the `mdlmb` register to be specified. The default value for this variant is `0xe` (`RWECC` and `ECCEN` are writable, all other bits are read-only).

Example: `-override iss/cpu0/andesExtensions/mdlmbMask=0xe`

2.1.9 Parameter `andesExtensions/PMA_grain`

This parameter allows the grain size of Physical Memory Attribute regions to be specified. The default value for this variant is `0`, meaning that PMA regions as small as 4 bytes are implemented.

Example: `-override iss/cpu0/andesExtensions/PMA_grain=16`

2.2 Hardware Stack Protection

Hardware Stack Protection is present on this variant (`mmisc_cfg.HSP=1`). Registers `mhsp_ctl`, `mhp_bound` and `mhp_base` are implemented.

2.3 Physical Memory Attribute Unit

The Physical Memory Attribute Unit is not present on this variant (mmsc_cfg.DPMA=0).

2.4 Performance Throttling

Performance Throttling registers are present on this variant (mmsc_cfg.PFT=1). Register mpft_ctl is present but has no behavior except for the effects on mxstatus, which are modeled.

2.5 Andes-Enhanced Performance Monitoring

Andes-Enhanced Performance Monitoring is present on this variant (mmsc_cfg.PMNS=1).

2.6 CSRs for CCTL Operations

CSRs for CCTL Operation are not present on this variant (mmsc_cfg.CCTLCSR=0).

2.7 Andes-Specific Instructions

This section describes Andes-specific instructions implemented by this variant. Refer to Andes reference documentation for more information.

2.7.1 Performance Extension Instructions

2.7.1.1 ADDIGP

31	30	21	20	19	17	16	15
imm[17]	imm[10:1]		imm[11]	imm[14:12]		imm[16:15]	
14	13	12	11	7	6	0	
imm[0]	01		Rd		Custom0 0001011		

Add the content of the implied GP (x3) register with a signed constant.

2.7.1.2 BBC

31	30	29	25	24	20	19	15
imm[10]	0	imm[9:5]		cimm[4:0]		Rs1	
14	12	11	8	7	6	0	
111		imm[4:1]		cimm[5]		Custom2 1011011	

Branch on bit is clear/zero.

2.7.1.3 BBS

31	30	29	25	24	20	19	15
imm[10]	1	imm[9:5]		cimm[4:0]		Rs1	
14	12	11	8	7		6	0
111		imm[4:1]		cimm[5]		Custom2	1011011

Branch on bit is set/non-zero.

2.7.1.4 BEQC

31	30	29	25	24	20	19	15
imm[10]	cimm[6]	imm[9:5]		cimm[4:0]		Rs1	
14	12	11	8	7		6	0
101		imm[4:1]		cimm[5]		Custom2	1011011

Branch on equal to a constant.

2.7.1.5 BNEC

31	30	29	25	24	20	19	15
imm[10]	cimm[6]	imm[9:5]		cimm[4:0]		Rs1	
14	12	11	8	7		6	0
110		imm[4:1]		cimm[5]		Custom2	1011011

Branch on not-equal to a constant.

2.7.1.6 BFOS

31	26	25	20	19	15	14	12	11	7	6	0
msb[5:0]		lsb[5:0]		Rs1		011		Rd		Custom2	1011011

Sign-extended bit-field extract or insert operation.

2.7.1.7 BFOZ

31	26	25	20	19	15	14	12	11	7	6	0
msb[5:0]		lsb[5:0]		Rs1		010		Rd		Custom2	1011011

Zero-extended bit-field extract or insert operation.

2.7.1.8 LEA.h

31	25	24	20	19	15	14	12	11	7	6	0
0000101		Rs2		Rs1		000		Rd		Custom2	1011011

Add a base register with a half-word-aligned offset from an offset register.

2.7.1.9 LEA.w

31	25	24	20	19	15	14	12	11	7	6	0
0000110		Rs2		Rs1		000		Rd		Custom2 1011011	

Add a base register with a word-aligned offset from an offset register.

2.7.1.10 LEA.d

31	25	24	20	19	15	14	12	11	7	6	0
0000111		Rs2		Rs1		000		Rd		Custom2 1011011	

Add a base register with a double-word-aligned offset from an offset register.

2.7.1.11 LEA.b.ze

31	25	24	20	19	15	14	12	11	7	6	0
0001000		Rs2		Rs1		000		Rd		Custom2 1011011	

Add a base register with an unsigned 32-bit byte offset from an offset register.

2.7.1.12 LEA.h.ze

31	25	24	20	19	15	14	12	11	7	6	0
0001001		Rs2		Rs1		000		Rd		Custom2 1011011	

Add a base register with an unsigned 32-bit half-word offset from an offset register.

2.7.1.13 LEA.w.ze

31	25	24	20	19	15	14	12	11	7	6	0
0001010		Rs2		Rs1		000		Rd		Custom2 1011011	

Add a base register with an unsigned 32-bit word offset from an offset register.

2.7.1.14 LEA.d.ze

31	25	24	20	19	15	14	12	11	7	6	0
0001011		Rs2		Rs1		000		Rd		Custom2 1011011	

Add a base register with an unsigned 32-bit double-word offset from an offset register.

2.7.1.15 LBGP

31	30	21	20	19	17	16	15
imm[17]		imm[10:1]		imm[11]		imm[14:12]	
14	13	12	11	7	6	0	
imm[0]		00		Rd		Custom0 0001011	

Load a sign-extended 8-bit byte from memory into a general register.

2.7.1.16 LBUGP

31	30	21	20	19	17	16	15
imm[17]		imm[10:1]		imm[11]		imm[16:15]	
14	13	12	11	7	6	0	
imm[0]		10		Rd		Custom0 0001011	

Load a zero-extended 8-bit byte from memory into a general register.

2.7.1.17 LHGP

31	30	21	20	19	17	16	15
imm[17]		imm[10:1]		imm[11]		imm[14:12]	
16	15	14	12	11	7	6	0
imm[16:15]		001		Rd		Custom1 0101011	

Load a sign-extended 16-bit half-word from memory into a general register.

2.7.1.18 LHUGP

31	30	21	20	19	17	16	15
imm[17]		imm[10:1]		imm[11]		imm[14:12]	
16	15	14	12	11	7	6	0
imm[16:15]		101		Rd		Custom1 0101011	

Load a zero-extended 16-bit half-word from memory into a general register.

2.7.1.19 LWGP

31	30	22	21	20	19	17	16
imm[18]		imm[10:2]		imm[17]		imm[14:12]	
16	15	14	12	11	7	6	0
imm[16:15]		010		Rd		Custom1 0101011	

Load a sign-extended 32-bit word from memory into a general register.

2.7.1.20 LWUGP

31	30	22	21	20	19	17
imm[18]	imm[10:2]		imm[17]	imm[11]	imm[14:12]	
16	15	14	12	11	7	6
imm[16:15]		110		Rd		Custom1 0101011

Load a zero-extended 32-bit word from memory into a general register.

2.7.1.21 LDGP

31	30	23	22	21	20	19	17
imm[19]	imm[10:3]		imm[18:17]		imm[11]	imm[14:12]	
16	15	14	12	11	7	6	0
imm[16:15]		011		Rd		Custom1 0101011	

Load a 64-bit double-word from memory into a general register.

2.7.1.22 SBGP

31	30	25	24	20	19	17	16	15
imm[17]	imm[10:5]		Rs2		imm[14:12]		imm[16:15]	
14	13	12	11	8	7	6	0	0
imm[0]		11		imm[4:1]		imm[11]		Custom0 0001011

Store an 8-bit byte from a general register into a memory location.

2.7.1.23 SHGP

31	30	25	24	20	19	17	16	15
imm[17]	imm[10:5]		Rs2		imm[14:12]		imm[16:15]	
14	12	11	8	7	6	0	0	0
000		imm[4:1]		imm[11]		Custom1 0101011		

Store a 16-bit half-word from a general register into a memory location.

2.7.1.24 SWGP

31	30	25	24	20	19	17	16	15
imm[18]	imm[10:5]		Rs2		imm[14:12]		imm[16:15]	
14	12	11	9	8	7	6	0	0
100		imm[4:2]		imm[17]		imm[11]		Custom1 0101011

Store a 32-bit word from a general register into a memory location.

2.7.1.25 SDGP

31	30	25	24	20	19	17	16	15
imm[19]		imm[10:5]		Rs2	imm[14:12]		imm[16:15]	
14	12	11	10	9	8	7	6	0
111		imm[4:3]		imm[18:17]		imm[11]		Custom1 0101011

Store a 64-bit double-word from a general register into a memory location.

2.7.1.26 FFB

31	25	24	20	19	15	14	12	11	7	6	0
0010000		Rs2		Rs1		000		Rd		Custom2 1011011	

Find the first byte in a first register that matches a value in a second register.

2.7.1.27 FFZMISM

31	25	24	20	19	15	14	12	11	7	6	0
0010001		Rs2		Rs1		000		Rd		Custom2 1011011	

Find the first byte in a register that is zero or fails a corresponding byte comparison.

2.7.1.28 FFMISM

31	25	24	20	19	15	14	12	11	7	6	0
0010010		Rs2		Rs1		000		Rd		Custom2 1011011	

Find the first byte in a register that fails a corresponding byte comparison.

2.7.1.29 FLMISM

31	25	24	20	19	15	14	12	11	7	6	0
0010011		Rs2		Rs1		000		Rd		Custom2 1011011	

Find the last byte in a register that fails a corresponding byte comparison.

2.7.2 CodeDense Instructions

2.7.2.1 EXEC.IT

15	13	12	9	8	7	6	2	1	0		
100		imm[10 4:3 8]		imm[11]		0		imm[7:6 2 9 5]		00	

Execute an instruction fetched from the instruction table.

2.7.2.2 EX9.IT

15	13	12	9	8	7	6	2	1	0
100		imm[10 4:3 8]			00		imm[7:6 2 9 5]		00

Execute an instruction fetched from the instruction table.

Chapter 3

Configuration

3.1 Location

This model's VLVN is `andes.ovpworld.org/processor/riscv/1.0`.

The model source is usually at:

`$IMPERAS_HOME/ImperasLib/source/andes.ovpworld.org/processor/riscv/1.0`

The model binary is usually at:

`$IMPERAS_HOME/lib/$IMPERAS_ARCH/ImperasLib/andes.ovpworld.org/processor/riscv/1.0`

3.2 GDB Path

The default GDB for this model is: `$IMPERAS_HOME/lib/$IMPERAS_ARCH/gdb/riscv-none-embed-gdb`.

3.3 Semi-Host Library

The default semi-host library file is `riscv.ovpworld.org/semihosting/pk/1.0`

3.4 Processor Endian-ness

This is a LITTLE endian model.

3.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

3.6 Processor ELF code

The ELF code supported by this model is: `0xf3`.

Chapter 4

All Variants in this model

This model has these variants

Variant	Description
N25	
NX25	
N25F	
NX25F	(described in this document)
A25	
AX25	
A25F	
AX25F	

Table 4.1: All Variants in this model

Chapter 5

Bus Master Ports

This model has these bus master ports.

Name	min	max	Connect?	Description
INSTRUCTION	32	64	mandatory	Instruction bus
DATA	32	64	optional	Data bus

Table 5.1: Bus Master Ports

Chapter 6

Bus Slave Ports

This model has no bus slave ports.

Chapter 7

Net Ports

This model has these net ports.

Name	Type	Connect?	Description
reset	input	optional	Reset
reset_addr	input	optional	externally-applied reset address
nmi	input	optional	NMI
nmi_addr	input	optional	externally-applied NMI address
MSWInterrupt	input	optional	Machine software interrupt
MTimerInterrupt	input	optional	Machine timer interrupt
MExternalInterrupt	input	optional	Machine external interrupt
irq_ack_o	output	optional	interrupt acknowledge (pulse)
irq_id_o	output	optional	acknowledged interrupt id (valid during irq_ack_o pulse)
sec_lvl_o	output	optional	current privilege level
LR_address	output	optional	Port written with effective address for LR instruction
SC_address	output	optional	Port written with effective address for SC instruction
SC_valid	input	optional	SC_address valid input signal
AMO_active	output	optional	Port written with code indicating active AMO
deferint	input	optional	Artifact signal causing interrupts to be held off when high

Table 7.1: Net Ports

Chapter 8

FIFO Ports

This model has no FIFO ports.

Chapter 9

Formal Parameters

Name	Type	Description
Fundamental		
variant	Enumeration	Selects variant (either a generic UISA or a specific model)
user_version	Enumeration	Specify required User Architecture version (2.2, 2.3 or 20190305)
priv_version	Enumeration	Specify required Privileged Architecture version (1.10, 1.11, 20190405 or master)
endian	Endian	Model endian
endianFixed	Boolean	Specify that data endianness is fixed (mstatus.{MBE,SBE,UBE} fields are read-only)
misa_MXL	Uns32	Override default value of misa.MXL
misa_Extensions	Uns32	Override default value of misa.Extensions
add_Extensions	String	Add extensions specified by letters to misa.Extensions (for example, specify “VD” to add V and D features)
misa_Extensions_mask	Uns32	Override mask of writable bits in misa.Extensions
add_Extensions_mask	String	Add extensions specified by letters to mask of writable bits in misa.Extensions (for example, specify “VD” to add V and D features)
Debug		
debug_version	Enumeration	Specify required Debug Architecture version (0.13.2-DRAFT or 0.14.0-DRAFT)
debug_mode	Enumeration	Specify how Debug mode is implemented (none, vector, interrupt or halt)
Floating Point		
mstatus_fs_mode	Enumeration	Specify conditions causing update of mstatus.FS to dirty (write_1, write_any or always_dirty)
d_requires_f	Boolean	If D and F extensions are separately enabled in the misa CSR, whether D is enabled only if F is enabled
mstatus_FS	Uns32	Override default value of mstatus.FS (initial state of floating point unit)
Zfh	Boolean	Specify that Zfh is implemented (IEEE half-precision floating point is supported)
Zfinx_version	Enumeration	Specify that Zfinx is implemented (use integer register file for floating point instructions) (none or 0.4)
Simulation Artifact		
ABI_d	Boolean	Specify whether D registers are used for parameters (ABI SemiHosting)
verbose	Boolean	Specify verbose output messages
enable_CSR_bus	Boolean	Add artifact CSR bus port, allowing CSR registers to be externally implemented
CSR_remap	String	Comma-separated list of CSR number mappings, each of the form <csr-Name>=<number>
Memory		
unaligned	Boolean	Specify whether the processor supports unaligned memory accesses
unalignedAMO	Boolean	Specify whether the processor supports unaligned memory accesses for AMO instructions

lr_sc_grain	Uns32	Specify byte granularity of ll/sc lock region (constrained to a power of two)
PMP_grain	Uns32	Specify PMP region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc)
PMP_registers	Uns32	Specify the number of implemented PMP address registers
PMP_max_page	Uns32	Specify the maximum size of PMP region to map if non-zero (may improve performance; constrained to a power of two)
PMP_decompose	Boolean	Whether unaligned PMP accesses are decomposed into separate aligned accesses
Instruction_CSR_Behavior		
wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)
counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers
noinhibit_mask	Uns32	Specify hardware-enforced mask of always-zero bits in mcountinhibit register
cycle_undefined	Boolean	Specify that the cycle CSR is undefined (reads to it are emulated by a Machine mode trap)
time_undefined	Boolean	Specify that the time CSR is undefined (reads to it are emulated by a Machine mode trap)
instret_undefined	Boolean	Specify that the instret CSR is undefined (reads to it are emulated by a Machine mode trap)
Interrupts_Exceptions		
mtvec_is_ro	Boolean	Specify whether mtvec CSR is read-only
tvec_align	Uns32	Specify hardware-enforced alignment of mtvec/stvec/utvec when Vectored interrupt mode enabled
ecode_mask	Uns64	Specify hardware-enforced mask of writable bits in xcause.ExceptionCode
ecode_nmi	Uns64	Specify xcause.ExceptionCode for NMI
tval_zero	Boolean	Specify whether mtval/stval/utval are hard wired to zero
tval_zero_ebreak	Boolean	Specify whether mtval/stval/utval are set to zero by an ebreak
tval_ii_code	Boolean	Specify whether mtval/stval contain faulting instruction bits on illegal instruction exception
xret_preserves_lr	Boolean	Whether an xRET instruction preserves the value of LR
reset_address	Uns64	Override reset vector address
nmi_address	Uns64	Override NMI vector address
local_int_num	Uns32	Specify number of supplemental local interrupts
unimp_int_mask	Uns64	Specify mask of unimplemented interrupts (e.g. 1<<9 indicates Supervisor external interrupt unimplemented)
force_mideleg	Uns64	Specify mask of interrupts always delegated to lower-priority execution level from Machine execution level
no_ideleg	Uns64	Specify mask of interrupts that cannot be delegated to lower-priority execution levels
no_e deleg	Uns64	Specify mask of exceptions that cannot be delegated to lower-priority execution levels
external_int_id	Boolean	Whether to add nets allowing External Interrupt ID codes to be forced
CSR_Masks		
mtvec_mask	Uns64	Specify hardware-enforced mask of writable bits in mtvec register
MXL_writable	Boolean	Specify that misa.MXL is writable (feature under development)
UXL_writable	Boolean	Specify that mstatus.UXL is writable (feature under development)
Trigger		
tinfo_undefined	Boolean	Specify that the tinfo CSR is undefined
tcontrol_undefined	Boolean	Specify that the tcontrol CSR is undefined
mcontext_undefined	Boolean	Specify that the mcontext CSR is undefined
scontext_undefined	Boolean	Specify that the scontext CSR is undefined
mscontext_undefined	Boolean	Specify that the mscontext CSR is undefined (Debug Version 0.14.0 and later)
amo_trigger	Boolean	Specify whether AMO load/store operations activate triggers
no_hit	Boolean	Specify that tdata1.hit is unimplemented
trigger_num	Uns32	Specify the number of implemented hardware triggers

tinfo	Uns32	Override tinfo register (for all triggers)
mcontext_bits	Uns32	Specify the number of implemented bits in mcontext
mvalue_bits	Uns32	Specify the number of implemented bits in textra.mvalue (if zero, textra.mselect is tied to zero)
mcontrol_maskmax	Uns32	Specify mcontrol.maskmax value
CSR_Defaults		
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override marchid register
mimpid	Uns64	Override mimpid register
mhartid	Uns64	Override mhartid register (or first mhartid of an incrementing sequence if this is an SMP variant)
mtvec	Uns64	Override mtvec register
Fast_Interrupt		
CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC absent

Table 9.1: Parameters that can be set in: Hart

9.1 Extension Parameters

Name	Type	Description
PMA_grain	Uns32	Specify PMA region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc)
milmb	Uns64	Override milmb register
mdlmb	Uns64	Override mdlmb register
mmsc_cfg	Uns64	Override mmsc_cfg register
micm_cfg	Uns64	Override micm_cfg register
mdcm_cfg	Uns64	Override mdcm_cfg register
uitb	Uns64	Override uitb register
milmbMask	Uns64	Override milmb register writable bit mask
mdlmbMask	Uns64	Override mdlmb register writable bit mask

Table 9.2: Parameters for andesExtensions

9.2 Parameters with enumerated types

9.2.1 Parameter user_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20190305
20190305	User Architecture Version 20190305-Base-Ratification

Table 9.3: Values for Parameter user_version

9.2.2 Parameter priv_version

Set to this value	Description
1.10	Privileged Architecture Version 1.10
1.11	Deprecated and equivalent to 20190405
20190405	Privileged Architecture Version 20190405-Priv-MSU-Ratification
master	Privileged Architecture Master Branch (1.12 draft)

Table 9.4: Values for Parameter priv_version

9.2.3 Parameter debug_version

Set to this value	Description
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT

Table 9.5: Values for Parameter debug_version

9.2.4 Parameter mstatus_fs_mode

Set to this value	Description
write_1	Any non-zero flag result sets mstatus.fs dirty
write_any	Any write of flags sets mstatus.fs dirty
always_dirty	mstatus.fs is either off or dirty

Table 9.6: Values for Parameter mstatus_fs_mode

9.2.5 Parameter debug_mode

Set to this value	Description
none	Debug mode not implemented
vector	Debug mode implemented by execution at vector
interrupt	Debug mode implemented by interrupt
halt	Debug mode implemented by halt

Table 9.7: Values for Parameter debug_mode

9.2.6 Parameter Zfinx_version

Set to this value	Description
none	Zfinx not implemented
0.4	Zfinx version 0.4

Table 9.8: Values for Parameter Zfinx_version

Chapter 10

Execution Modes

Mode	Code	Description
User	0	User mode
Machine	3	Machine mode

Table 10.1: Modes implemented in: Hart

Chapter 11

Exceptions

Exception	Code	Description
InstructionAddressMisaligned	0	Fetch from unaligned address
InstructionAccessFault	1	No access permission for fetch
IllegalInstruction	2	Undecoded, unimplemented or disabled instruction
Breakpoint	3	EBREAK instruction executed
LoadAddressMisaligned	4	Load from unaligned address
LoadAccessFault	5	No access permission for load
StoreAMOAddressMisaligned	6	Store/atomic memory operation at unaligned address
StoreAMOAccessFault	7	No access permission for store/atomic memory operation
EnvironmentCallFromUMode	8	ECALL instruction executed in User mode
EnvironmentCallFromMMode	11	ECALL instruction executed in Machine mode
InstructionPageFault	12	Page fault at fetch address
LoadPageFault	13	Page fault at load address
StoreAMOPageFault	15	Page fault at store/atomic memory operation address
HSP_OVF	32	Stack overflow
HSP_UDF	33	Stack underflow
MSWInterrupt	67	Machine software interrupt
MTimerInterrupt	71	Machine timer interrupt
MExternalInterrupt	75	Machine external interrupt

Table 11.1: Exceptions implemented in: Hart

Chapter 12

Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

12.1 Level 1: Hart

This level in the model hierarchy has 2 commands.

This level in the model hierarchy has 5 register groups:

Group name	Registers
Core	33
Floating_point	32
User_Control_and_Status	36
Machine_Control_and_Status	116
Integration_support	2

Table 12.1: Register groups

This level in the model hierarchy has no children.

Chapter 13

Model Commands

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

13.1 Level 1: Hart

13.1.1 isync

specify instruction address range for synchronous execution

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

Table 13.1: isync command arguments

13.1.2 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-instructioncount	Boolean	include the instruction number in each trace
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 13.2: itrace command arguments

Chapter 14

Registers

14.1 Level 1: Hart

14.1.1 Core

Registers at level:1, type:Hart group:Core

Name	Bits	Initial-Hex	RW	Description
