# Chapter 1

## Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

### 1.1 Description

ARM Processor Model

### 1.2 Licensing

Usage of binary model under license governing simulator usage.

Note that for models of ARM CPUs the license includes the following terms:

Licensee is granted a non-exclusive, worldwide, non-transferable, revocable licence to:

If no source is being provided to the Licensee: use and copy only (no modifications rights are granted) the model for the sole purpose of designing, developing, analyzing, debugging, testing, verifying, validating and optimizing software which: (a) (i) is for ARM based systems; and (ii) does not incorporate the ARM Models or any part thereof; and (b) such ARM Models may not be used

to emulate an ARM based system to run application software in a production or live environment.

If source code is being provided to the Licensee: use, copy and modify the model for the sole purpose of designing, developing, analyzing, debugging, testing, verifying, validating and optimizing software which: (a) (i) is for ARM based systems; and (ii) does not incorporate the ARM Models or any part thereof; and (b) such ARM Models may not be used to emulate an ARM based system to run application software in a production or live environment.

In the case of any Licensee who is either or both an academic or educational institution the purposes shall be limited to internal use.

Except to the extent that such activity is permitted by applicable law, Licensee shall not reverse engineer, decompile, or disassemble this model. If this model was provided to Licensee in Europe, Licensee shall not reverse engineer, decompile or disassemble the Model for the purposes of error correction.

The License agreement does not entitle Licensee to manufacture in silicon any product based on this model.

The License agreement does not entitle Licensee to use this model for evaluating the validity of any ARM patent.

Source of model available under separate Imperas Software License Agreement.

### 1.3 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. ISB, CP15ISB) are treated as NOPs, with the exception of any undefined instruction behavior, which is modeled. The model does not implement speculative fetch behavior. The branch cache is not modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous (as if the memory was of Strongly Ordered or Device-nGnRnE type). Data barrier instructions (e.g. DSB, CP15DSB) are treated as NOPs, with the exception of any undefined instruction behavior, which is modeled. Cache manipulation instructions are implemented as NOPs, with the exception of any undefined instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Performance Monitors are implemented as a register interface only except for the cycle counter, which is implemented assuming one instruction per cycle.

TLBs are architecturally-accurate but not device accurate. This means that all TLB maintenance and address translation operations are fully implemented but the cache is larger than in the real device.

## 1.4 Verification

Models have been extensively tested by Imperas. ARM Cortex-A models have been successfully used by customers to simulate SMP Linux, Ubuntu Desktop, VxWorks and ThreadX on Xilinx Zynq virtual platforms.

## 1.5 Features

### 1.5.1 Core Features

Thumb-2 instructions are supported.

Trivial Jazelle extension is implemented.

### 1.5.2 Memory System

Security extensions are implemented (also known as TrustZone). Non-secure accesses can be made visible externally by connecting the processor to a 41-bit physical bus, in which case bits 39..0 give the true physical address and bit 40 is the NS bit.

VMSA secure and non-secure address translation is implemented.

TLB behavior is controlled by parameter ASIDCacheSize. If this parameter is 0, then an unlimited number of TLB entries will be maintained concurrently. If this parameter is non-zero, then only TLB entries for up to ASIDCacheSize different ASIDs will be maintained concurrently initially; as new ASIDs are used, TLB entries for less-recently used ASIDs are deleted, which improves model performance in some cases (especially when 16-bit ASIDs are in use). If the model detects that the TLB entry cache is too small (entry ejections are very frequent), it will increase the cache size automatically. In this variant, ASIDCacheSize is 8

### 1.5.3 Advanced SIMD and Floating-Point Features

SIMD and VFP instructions are implemented.

The model implements trapped exceptions if FPTrap is set to 1 in MVFR0 (for AArch32) or MVFR0\_EL1 (for AArch64). When floating point exception traps are taken, cumulative exception flags are not updated (in other words, cumulative flag state is always the same as prior to instruction execution, even for SIMD instructions). When multiple enabled exceptions are raised by a single floating point operation, the exception reported is the one in least-significant bit position in FPSCR (for AArch32) or FPCR (for AArch64). When multiple enabled exceptions are raised by different SIMD element computations, the exception reported is selected from the lowest-index-number SIMD operation. Contact Imperas if requirements for exception reporting differ from these.

Trapped exceptions not are implemented in this variant (FPTrap=0)

### 1.5.4 Generic Interrupt Controller

GIC block is implemented (GICv1, including security extensions). Accesses to GIC registers can be viewed externally by connecting to the 32-bit GICRegisters bus port. Secure register accesses are at offset 0x0 on this bus; for example, a secure access to GIC register ICDDCR can be observed by monitoring address 0x00001000. Non-secure accesses are at offset 0x80000000 on this bus; for example, a non-secure access to GIC register ICDDCR can be observed by monitoring address 0x80001000

## 1.6 Debug Mask

It is possible to enable model debug features in various categories. This can be done statically using the “override\_debugMask” parameter, or dynamically using the “debugflags” command. Enabled debug features are specified using a bitmask value, as follows:

Value 0x004: enable debugging of MMU/MPU mappings.

Value 0x020: enable debugging of reads and writes of GIC block registers.

Value 0x040: enable debugging of exception routing via the GIC model component.

Value 0x080: enable debugging of all system register accesses.

Value 0x100: enable debugging of all traps of system register accesses.

Value 0x200: enable verbose debugging of other miscellaneous behavior (for example, the reason why a particular instruction is undefined).

Value 0x400: enable debugging of Performance Monitor timers

Value 0x800: enable dynamic validation of TLB entries against in-memory page table contents (finds some classes of error where page table entries are updated without a subsequent flush of affected TLB entries).

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

## 1.7 AArch32 Unpredictable Behavior

Many AArch32 instruction behaviors are described in the ARM ARM as CONSTRAINED UNPREDICTABLE. This section describes how such situations are handled by this model.

### 1.7.1 Equal Target Registers

Some instructions allow the specification of two target registers (for example, double-width SMULL, or some VMOV variants), and such instructions are CONSTRAINED UNPREDICTABLE if the same target register is specified in both positions. In this model, such instructions are treated as UNDEFINED.

### 1.7.2 Floating Point Load/Store Multiple Lists

Instructions that load or store a list of floating point registers (e.g. VSTM, VLDM, VPUSH, VPOP) are **CONSTRAINED UNPREDICTABLE** if either the uppermost register in the specified range is greater than 32 or (for 64-bit registers) if more than 16 registers are specified. In this model, such instructions are treated as **UNDEFINED**.

### 1.7.3 Floating Point VLD[2-4]/VST[2-4] Range Overflow

Instructions that load or store a fixed number of floating point registers (e.g. VST2, VLD2) are **CONSTRAINED UNPREDICTABLE** if the upper register bound exceeds the number of implemented floating point registers. In this model, these instructions load and store using modulo 32 indexing (consistent with AArch64 instructions with similar behavior).

### 1.7.4 If-Then (IT) Block Constraints

Where the behavior of an instruction in an if-then (IT) block is described as **CONSTRAINED UNPREDICTABLE**, this model treats that instruction as **UNDEFINED**.

### 1.7.5 Use of R13

In architecture variants before ARMv8, use of R13 was described as **CONSTRAINED UNPREDICTABLE** in many circumstances. From ARMv8, most of these situations are no longer considered unpredictable. This model allows R13 to be used like any other GPR, consistent with the ARMv8 specification.

### 1.7.6 Use of R15

Use of R15 is described as **CONSTRAINED UNPREDICTABLE** in many circumstances. This model allows such use to be configured using the parameter “unpredictableR15” as follows:

Value “undefined”: any reference to R15 in such a situation is treated as **UNDEFINED**;

Value “nop”: any reference to R15 in such a situation causes the instruction to be treated as a **NOP**;

Value “raz\_wi”: any reference to R15 in such a situation causes the instruction to be treated as a **RAZ/WI** (that is, R15 is read as zero and write-ignored);

Value “execute”: any reference to R15 in such a situation is executed using the current value of R15 on read, and writes to R15 are allowed (but are not interworking).

Value “assert”: any reference to R15 in such a situation causes the simulation to halt with an assertion message (allowing any such unpredictable uses to be easily identified).

In this variant, the default value of “unpredictableR15” is “undefined”.

### 1.7.7 Unpredictable Instructions in Some Modes

Some instructions are described as `CONSTRAINED UNPREDICTABLE` in some modes only (for example, MSR accessing SPSR is `CONSTRAINED UNPREDICTABLE` in User and System modes). This model allows such use to be configured using the parameter “unpredictableModal”, which can have values “undefined” or “nop”. See the previous section for more information about the meaning of these values.

In this variant, the default value of “unpredictableModal” is “nop”.

## 1.8 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

### 1.8.1 Memory Transaction Query

Two registers are intended for use within memory callback functions to provide additional information about the current memory access. Register `transactPL` indicates the processor execution level of the current access (0-3). Note that for load/store translate instructions (e.g. `LDRT`, `STRT`) the reported execution level will be 0, indicating an `EL0` access. Register `transactAT` indicates the type of memory access: 0 for a normal read or write; and 1 for a physical access resulting from a page table walk.

### 1.8.2 Page Table Walk Query

A banked set of registers provides information about the most recently completed page table walk. There are up to six banks of registers: bank 0 is for stage 1 walks, bank 1 is for stage 2 walks, and banks 2-5 are for stage 2 walks initiated by stage 1 level 0-3 entry lookups, respectively. Banks 1-5 are present only for processors with virtualization extensions. The currently active bank can be set using register `PTWBankSelect`. Register `PTWBankValid` is a bitmask indicating which banks contain valid data: for example, the value `0xb` indicates that banks 0, 1 and 3 contain valid data.

Within each bank, there are registers that record addresses and values read during that page table walk. Register `PTWBase` records the table base address, register `PTWInput` contains the input address that starts a walk, register `PTWOutput` contains the result address and register `PTWPgSize` contains the page size (`PTWOutput` and `PTWPgSize` are valid only if the page table walk completes). Registers `PTWAddressL0-PTWAddressL3` record the addresses of level 0 to level 3 entries read, respectively. Register `PTWAddressValid` is a bitmask indicating which address registers contain valid data: bits 0-3 indicate `PTWAddressL0-PTWAddressL3`, respectively, bit 4 indicates `PTWBase`, bit 5 indicates `PTWInput`, bit 6 indicates both `PTWOutput` and `PTWPgSize`. For example, the value `0x73` indicates that `PTWBase`, `PTWInput`, `PTWOutput`, `PTWPgSize` and `PTWAddressL0-L1` are valid but `PTWAddressL2-L3` are not. Register `PTWAddressNS` is a bitmask indicating whether an address is in non-secure memory: bits 0-3 indicate `PTWAddressL0-PTWAddressL3`, respectively, bit 4 indicates `PTWBase`, bit 6 indicates `PTWOutput` (`PTWInput` is a VA and thus has no secure/non-secure info). Registers `PTWValueL0-PTWValueL3` contain page

table entry values read at level 0 to level 3. Register `PTWValueValid` is a bitmask indicating which value registers contain valid data: bits 0-3 indicate `PTWValueL0`-`PTWValueL3`, respectively.

### 1.8.3 Artifact Page Table Walks

Registers are also available to enable a simulation environment to initiate an artifact page table walk (for example, to determine the ultimate PA corresponding to a given VA). Register `PTWI_EL1S` initiates a secure EL1 table walk for a fetch. Register `PTWD_EL1S` initiates a secure EL1 table walk for a load or store (note that current ARM processors have unified TLBs, so these registers are synonymous). Registers `PTW[ID]_EL1NS` initiate walks for non-secure EL1 accesses. Registers `PTW[ID]_EL2` initiate EL2 walks. Registers `PTW[ID]_S2` initiate stage 2 walks. Registers `PTW[ID]_EL3` initiate AArch64 EL3 walks. Finally, registers `PTW[ID]_current` initiate current-mode walks (useful in a memory callback context). Each walk fills the query registers described above.

### 1.8.4 MMU and Page Table Walk Events

Two events are available that allow a simulation environment to be notified on MMU and page table walk actions. Event `mmuEnable` triggers when any MMU is enabled or disabled. Event `pageTableWalk` triggers on completion of any page table walk (including artifact walks).

### 1.8.5 Artifact Address Translations

A simulation environment can trigger an artifact address translation operation by writing to the architectural address translation registers (e.g. `ATS1CPR`). The results of such translations are written to an integration support register `artifactPAR`, instead of the architectural `PAR` register. This means that such artifact writes will not perturb architectural state.

### 1.8.6 TLB Invalidation

A simulation environment can cause TLB state for one or more address translation regimes in the processor to be flushed by writing to the artifact register `ResetTLBs`. The argument is a bitmask value, in which non-zero bits select the TLBs to be flushed, as follows:

Bit 0: EL0/EL1 stage 1 secure TLB

Bit 1: EL0/EL1 stage 1 non-secure TLB

### 1.8.7 Halt Reason Introspection

An artifact register `HaltReason` can be read to determine the reason or reasons that a processor is halted. This register is a bitfield, with the following encoding: bit 0 indicates the processor has executed a wait-for-event (WFE) instruction; bit 1 indicates the processor has executed a wait-for-interrupt (WFI) instruction; and bit 2 indicates the processor is held in reset.

### 1.8.8 System Register Access Monitor

If parameter “enableSystemMonitorBus” is True, an artifact 32-bit bus “SystemMonitor” is enabled for each PE. Every system register read or write by that PE is then visible as a read or write on this artifact bus, and can therefore be monitored using callbacks installed in the client environment (use `opBusReadMonitorAdd/opBusWriteMonitorAdd` or `icmAddBusReadCallback/icmAddBusWriteCallback`, depending on the client API). The format of the address on the bus is as follows:

bits 31:26 - zero

bit 25 - 1 if AArch64 access, 0 if AArch32 access

bit 24 - 1 if non-secure access, 0 if secure access

bits 23:20 - CRm value

bits 19:16 - CRn value

bits 15:12 - op2 value

bits 11:8 - op1 value

bits 7:4 - op0 value (AArch64) or coprocessor number (AArch32)

bits 3:0 - zero

As an example, to view non-secure writes to writes to `CNTFRQ_EL0` in AArch64 state, install a write monitor on address range `0x020e0330:0x020e0333`.

### 1.8.9 System Register Implementation

If parameter “enableSystemBus” is True, an artifact 32-bit bus “System” is enabled for each PE. Slave callbacks installed on this bus can be used to implement modified system register behavior (use `opBusSlaveNew` or `icmMapExternalMemory`, depending on the client API). The format of the address on the bus is the same as for the system monitor bus, described above.

## 1.9 Description

ARM Processor Model

### 1.10 Licensing

Usage of binary model under license governing simulator usage.

Note that for models of ARM CPUs the license includes the following terms:

Licensee is granted a non-exclusive, worldwide, non-transferable, revocable licence to:

If no source is being provided to the Licensee: use and copy only (no modifications rights are granted) the model for the sole purpose of designing, developing, analyzing, debugging, testing,

verifying, validating and optimizing software which: (a) (i) is for ARM based systems; and (ii) does not incorporate the ARM Models or any part thereof; and (b) such ARM Models may not be used to emulate an ARM based system to run application software in a production or live environment.

If source code is being provided to the Licensee: use, copy and modify the model for the sole purpose of designing, developing, analyzing, debugging, testing, verifying, validating and optimizing software which: (a) (i) is for ARM based systems; and (ii) does not incorporate the ARM Models or any part thereof; and (b) such ARM Models may not be used to emulate an ARM based system to run application software in a production or live environment.

In the case of any Licensee who is either or both an academic or educational institution the purposes shall be limited to internal use.

Except to the extent that such activity is permitted by applicable law, Licensee shall not reverse engineer, decompile, or disassemble this model. If this model was provided to Licensee in Europe, Licensee shall not reverse engineer, decompile or disassemble the Model for the purposes of error correction.

The License agreement does not entitle Licensee to manufacture in silicon any product based on this model.

The License agreement does not entitle Licensee to use this model for evaluating the validity of any ARM patent.

Source of model available under separate Imperas Software License Agreement.

## 1.11 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. ISB, CP15ISB) are treated as NOPs, with the exception of any undefined instruction behavior, which is modeled. The model does not implement speculative fetch behavior. The branch cache is not modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous (as if the memory was of Strongly Ordered or Device-nGnRnE type). Data barrier instructions (e.g. DSB, CP15DSB) are treated as NOPs, with the exception of any undefined instruction behavior, which is modeled. Cache manipulation instructions are implemented as NOPs, with the exception of any undefined instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Performance Monitors are implemented as a register interface only except for the cycle counter, which is implemented assuming one instruction per cycle.

TLBs are architecturally-accurate but not device accurate. This means that all TLB maintenance and address translation operations are fully implemented but the cache is larger than in the real device.

## 1.12 Verification

Models have been extensively tested by Imperas. ARM Cortex-A models have been successfully used by customers to simulate SMP Linux, Ubuntu Desktop, VxWorks and ThreadX on Xilinx Zynq virtual platforms.

## 1.13 Features

### 1.13.1 Core Features

Thumb-2 instructions are supported.

Trivial Jazelle extension is implemented.

### 1.13.2 Memory System

Security extensions are implemented (also known as TrustZone). Non-secure accesses can be made visible externally by connecting the processor to a 41-bit physical bus, in which case bits 39..0 give the true physical address and bit 40 is the NS bit.

VMSA secure and non-secure address translation is implemented.

TLB behavior is controlled by parameter ASIDCacheSize. If this parameter is 0, then an unlimited number of TLB entries will be maintained concurrently. If this parameter is non-zero, then only TLB entries for up to ASIDCacheSize different ASIDs will be maintained concurrently initially; as new ASIDs are used, TLB entries for less-recently used ASIDs are deleted, which improves model performance in some cases (especially when 16-bit ASIDs are in use). If the model detects that the TLB entry cache is too small (entry ejections are very frequent), it will increase the cache size automatically. In this variant, ASIDCacheSize is 8

### 1.13.3 Advanced SIMD and Floating-Point Features

SIMD and VFP instructions are implemented.

The model implements trapped exceptions if FPTrap is set to 1 in MVFR0 (for AArch32) or MVFR0\_EL1 (for AArch64). When floating point exception traps are taken, cumulative exception flags are not updated (in other words, cumulative flag state is always the same as prior to instruction execution, even for SIMD instructions). When multiple enabled exceptions are raised by a single floating point operation, the exception reported is the one in least-significant bit position in FPSCR (for AArch32) or FPCR (for AArch64). When multiple enabled exceptions are raised by different SIMD element computations, the exception reported is selected from the lowest-index-number SIMD operation. Contact Imperas if requirements for exception reporting differ from these.

Trapped exceptions not are implemented in this variant (FPTrap=0)

### 1.13.4 Generic Interrupt Controller

GIC block is implemented (GICv1, including security extensions). Accesses to GIC registers can be viewed externally by connecting to the 32-bit GICRegisters bus port. Secure register accesses are at offset 0x0 on this bus; for example, a secure access to GIC register ICDDCR can be observed by monitoring address 0x00001000. Non-secure accesses are at offset 0x80000000 on this bus; for example, a non-secure access to GIC register ICDDCR can be observed by monitoring address 0x80001000

## 1.14 Debug Mask

It is possible to enable model debug features in various categories. This can be done statically using the “override\_debugMask” parameter, or dynamically using the “debugflags” command. Enabled debug features are specified using a bitmask value, as follows:

Value 0x004: enable debugging of MMU/MPU mappings.

Value 0x020: enable debugging of reads and writes of GIC block registers.

Value 0x040: enable debugging of exception routing via the GIC model component.

Value 0x080: enable debugging of all system register accesses.

Value 0x100: enable debugging of all traps of system register accesses.

Value 0x200: enable verbose debugging of other miscellaneous behavior (for example, the reason why a particular instruction is undefined).

Value 0x400: enable debugging of Performance Monitor timers

Value 0x800: enable dynamic validation of TLB entries against in-memory page table contents (finds some classes of error where page table entries are updated without a subsequent flush of affected TLB entries).

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

## 1.15 AArch32 Unpredictable Behavior

Many AArch32 instruction behaviors are described in the ARM ARM as CONSTRAINED UNPREDICTABLE. This section describes how such situations are handled by this model.

### 1.15.1 Equal Target Registers

Some instructions allow the specification of two target registers (for example, double-width SMULL, or some VMOV variants), and such instructions are CONSTRAINED UNPREDICTABLE if the same target register is specified in both positions. In this model, such instructions are treated as UNDEFINED.

### 1.15.2 Floating Point Load/Store Multiple Lists

Instructions that load or store a list of floating point registers (e.g. VSTM, VLDM, VPUSH, VPOP) are **CONSTRAINED UNPREDICTABLE** if either the uppermost register in the specified range is greater than 32 or (for 64-bit registers) if more than 16 registers are specified. In this model, such instructions are treated as **UNDEFINED**.

### 1.15.3 Floating Point VLD[2-4]/VST[2-4] Range Overflow

Instructions that load or store a fixed number of floating point registers (e.g. VST2, VLD2) are **CONSTRAINED UNPREDICTABLE** if the upper register bound exceeds the number of implemented floating point registers. In this model, these instructions load and store using modulo 32 indexing (consistent with AArch64 instructions with similar behavior).

### 1.15.4 If-Then (IT) Block Constraints

Where the behavior of an instruction in an if-then (IT) block is described as **CONSTRAINED UNPREDICTABLE**, this model treats that instruction as **UNDEFINED**.

### 1.15.5 Use of R13

In architecture variants before ARMv8, use of R13 was described as **CONSTRAINED UNPREDICTABLE** in many circumstances. From ARMv8, most of these situations are no longer considered unpredictable. This model allows R13 to be used like any other GPR, consistent with the ARMv8 specification.

### 1.15.6 Use of R15

Use of R15 is described as **CONSTRAINED UNPREDICTABLE** in many circumstances. This model allows such use to be configured using the parameter “unpredictableR15” as follows:

Value “undefined”: any reference to R15 in such a situation is treated as **UNDEFINED**;

Value “nop”: any reference to R15 in such a situation causes the instruction to be treated as a **NOP**;

Value “raz\_wi”: any reference to R15 in such a situation causes the instruction to be treated as a **RAZ/WI** (that is, R15 is read as zero and write-ignored);

Value “execute”: any reference to R15 in such a situation is executed using the current value of R15 on read, and writes to R15 are allowed (but are not interworking).

Value “assert”: any reference to R15 in such a situation causes the simulation to halt with an assertion message (allowing any such unpredictable uses to be easily identified).

In this variant, the default value of “unpredictableR15” is “undefined”.

### 1.15.7 Unpredictable Instructions in Some Modes

Some instructions are described as `CONSTRAINED UNPREDICTABLE` in some modes only (for example, MSR accessing SPSR is `CONSTRAINED UNPREDICTABLE` in User and System modes). This model allows such use to be configured using the parameter “unpredictableModal”, which can have values “undefined” or “nop”. See the previous section for more information about the meaning of these values.

In this variant, the default value of “unpredictableModal” is “nop”.

## 1.16 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

### 1.16.1 Memory Transaction Query

Two registers are intended for use within memory callback functions to provide additional information about the current memory access. Register `transactPL` indicates the processor execution level of the current access (0-3). Note that for load/store translate instructions (e.g. `LDRT`, `STRT`) the reported execution level will be 0, indicating an `EL0` access. Register `transactAT` indicates the type of memory access: 0 for a normal read or write; and 1 for a physical access resulting from a page table walk.

### 1.16.2 Page Table Walk Query

A banked set of registers provides information about the most recently completed page table walk. There are up to six banks of registers: bank 0 is for stage 1 walks, bank 1 is for stage 2 walks, and banks 2-5 are for stage 2 walks initiated by stage 1 level 0-3 entry lookups, respectively. Banks 1-5 are present only for processors with virtualization extensions. The currently active bank can be set using register `PTWBankSelect`. Register `PTWBankValid` is a bitmask indicating which banks contain valid data: for example, the value `0xb` indicates that banks 0, 1 and 3 contain valid data.

Within each bank, there are registers that record addresses and values read during that page table walk. Register `PTWBase` records the table base address, register `PTWInput` contains the input address that starts a walk, register `PTWOutput` contains the result address and register `PTWPgSize` contains the page size (`PTWOutput` and `PTWPgSize` are valid only if the page table walk completes). Registers `PTWAddressL0-PTWAddressL3` record the addresses of level 0 to level 3 entries read, respectively. Register `PTWAddressValid` is a bitmask indicating which address registers contain valid data: bits 0-3 indicate `PTWAddressL0-PTWAddressL3`, respectively, bit 4 indicates `PTWBase`, bit 5 indicates `PTWInput`, bit 6 indicates both `PTWOutput` and `PTWPgSize`. For example, the value `0x73` indicates that `PTWBase`, `PTWInput`, `PTWOutput`, `PTWPgSize` and `PTWAddressL0-L1` are valid but `PTWAddressL2-L3` are not. Register `PTWAddressNS` is a bitmask indicating whether an address is in non-secure memory: bits 0-3 indicate `PTWAddressL0-PTWAddressL3`, respectively, bit 4 indicates `PTWBase`, bit 6 indicates `PTWOutput` (`PTWInput` is a VA and thus has no secure/non-secure info). Registers `PTWValueL0-PTWValueL3` contain page

table entry values read at level 0 to level 3. Register `PTWValueValid` is a bitmask indicating which value registers contain valid data: bits 0-3 indicate `PTWValueL0`-`PTWValueL3`, respectively.

### 1.16.3 Artifact Page Table Walks

Registers are also available to enable a simulation environment to initiate an artifact page table walk (for example, to determine the ultimate PA corresponding to a given VA). Register `PTWI_EL1S` initiates a secure EL1 table walk for a fetch. Register `PTWD_EL1S` initiates a secure EL1 table walk for a load or store (note that current ARM processors have unified TLBs, so these registers are synonymous). Registers `PTW[ID]_EL1NS` initiate walks for non-secure EL1 accesses. Registers `PTW[ID]_EL2` initiate EL2 walks. Registers `PTW[ID]_S2` initiate stage 2 walks. Registers `PTW[ID]_EL3` initiate AArch64 EL3 walks. Finally, registers `PTW[ID]_current` initiate current-mode walks (useful in a memory callback context). Each walk fills the query registers described above.

### 1.16.4 MMU and Page Table Walk Events

Two events are available that allow a simulation environment to be notified on MMU and page table walk actions. Event `mmuEnable` triggers when any MMU is enabled or disabled. Event `pageTableWalk` triggers on completion of any page table walk (including artifact walks).

### 1.16.5 Artifact Address Translations

A simulation environment can trigger an artifact address translation operation by writing to the architectural address translation registers (e.g. `ATS1CPR`). The results of such translations are written to an integration support register `artifactPAR`, instead of the architectural `PAR` register. This means that such artifact writes will not perturb architectural state.

### 1.16.6 TLB Invalidation

A simulation environment can cause TLB state for one or more address translation regimes in the processor to be flushed by writing to the artifact register `ResetTLBs`. The argument is a bitmask value, in which non-zero bits select the TLBs to be flushed, as follows:

Bit 0: EL0/EL1 stage 1 secure TLB

Bit 1: EL0/EL1 stage 1 non-secure TLB

### 1.16.7 Halt Reason Introspection

An artifact register `HaltReason` can be read to determine the reason or reasons that a processor is halted. This register is a bitfield, with the following encoding: bit 0 indicates the processor has executed a wait-for-event (WFE) instruction; bit 1 indicates the processor has executed a wait-for-interrupt (WFI) instruction; and bit 2 indicates the processor is held in reset.

### 1.16.8 System Register Access Monitor

If parameter “enableSystemMonitorBus” is True, an artifact 32-bit bus “SystemMonitor” is enabled for each PE. Every system register read or write by that PE is then visible as a read or write on this artifact bus, and can therefore be monitored using callbacks installed in the client environment (use `opBusReadMonitorAdd/opBusWriteMonitorAdd` or `icmAddBusReadCallback/icmAddBusWriteCallback`, depending on the client API). The format of the address on the bus is as follows:

bits 31:26 - zero

bit 25 - 1 if AArch64 access, 0 if AArch32 access

bit 24 - 1 if non-secure access, 0 if secure access

bits 23:20 - CRm value

bits 19:16 - CRn value

bits 15:12 - op2 value

bits 11:8 - op1 value

bits 7:4 - op0 value (AArch64) or coprocessor number (AArch32)

bits 3:0 - zero

As an example, to view non-secure writes to writes to `CNTFRQ_EL0` in AArch64 state, install a write monitor on address range `0x020e0330:0x020e0333`.

### 1.16.9 System Register Implementation

If parameter “enableSystemBus” is True, an artifact 32-bit bus “System” is enabled for each PE. Slave callbacks installed on this bus can be used to implement modified system register behavior (use `opBusSlaveNew` or `icmMapExternalMemory`, depending on the client API). The format of the address on the bus is the same as for the system monitor bus, described above.

## Chapter 2

# Configuration

### 2.1 Location

This model's VLVN is `arm.ovpworld.org/processor/arm/1.0`.

The model source is usually at:

`$IMPERAS_HOME/ImperasLib/source/arm.ovpworld.org/processor/arm/1.0`

The model binary is usually at:

`$IMPERAS_HOME/lib/$IMPERAS_ARCH/ImperasLib/arm.ovpworld.org/processor/arm/1.0`

### 2.2 GDB Path

The default GDB for this model is: `$IMPERAS_HOME/lib/$IMPERAS_ARCH/gdb/arm-none-eabi-gdb`.

### 2.3 Semi-Host Library

The default semi-host library file is `arm.ovpworld.org/semihosting/armNewlib/1.0`

### 2.4 Processor Endian-ness

This model can be set to either endian-ness (normally by a pin, or the ELF code).

### 2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

### 2.6 Processor ELF code

The ELF code supported by this model is: `0x28`.

EVENTO	output	optional	Event output signal, active on rising edge
wdResetReq_CPU0	output	optional	Watchdog interrupt request
wdReset_CPU0	input	optional	Watchdog reset (active high)
scuReset	input	optional	SCU reset (active high)
CLUSTERIDAFF1	input	optional	Configure MPIDR.Aff1
CLUSTERIDAFF2	input	optional	Configure MPIDR.Aff2

VINITHI_CPU0	input	optional	Configure HIVECS mode (SCTLR.V)
CFGEND_CPU0	input	optional	Configure exception endianness (SCTLR.EE)
TEINIT_CPU0	input	optional	Configure exception state at reset (SCTLR.TE)
CFGNMFI_CPU0	input	optional	Configure non-maskable fast interrupts (SCTLR.NMFI)
reset_CPU0	input	optional	Processor reset, active high
fiq_CPU0	input	optional	FIQ interrupt, active high (negation of nFIQ)
irq_CPU0	input	optional	IRQ interrupt, active high (negation of nIRQ)
sei_CPU0	input	optional	System error interrupt, active on rising edge (negation of nSEI)
AXI.SLVERR_CPU0	input	optional	AXI external abort type (DECERR=0, SLVERR=1)
CP15SDISABLE_CPU0	input	optional	CP15SDISABLE (active high)

Table 6.1: Net Ports

## Chapter 7

# FIFO Ports

This model has no FIFO ports.

## Chapter 8

# Formal Parameters

Name	Type	Description
variant	Enumeration	Selects variant (either a generic ISA or a specific model)
verbose	Boolean	Specify verbosity of output
suppressCPSWarnings	Boolean	Suppress duplicate warnings generated using ARM_CP_CPSI or ARM_CP_CPSD message identifiers
showHiddenRegs	Boolean	Show hidden registers during register tracing
UAL	Boolean	Disassemble using UAL syntax
disableGICModel	Boolean	Disable the internal GIC model entirely
enableGICv2.64kB_Page	Boolean	Enable 64kB page size for GICv2 memory-mapped register groups (Xilinx Zynq Ultrascale support)
enableVFPAtReset	Boolean	Enable vector floating point (SIMD and VFP) instructions at reset. (Enables cp10/11 in CPACR and sets FPEXC.EN)
enableSystemBus	Boolean	Add 32-bit artifact System bus port, allowing system registers to be externally implemented
enableSystemMonitorBus	Boolean	Add 32-bit artifact SystemMonitor bus port, allowing system register accesses to be externally monitored
compatibility	Enumeration	Specify compatibility mode (ISA, gdb or nopSVC)
unpredictableR15	Enumeration	Specify behavior for UNPREDICTABLE uses of AArch32 R15 register (undefined, nop, raz_wi, execute or assert)
unpredictableModal	Enumeration	Specify behavior for UNPREDICTABLE instructions in certain AArch32 modes (for example, MRS using SPSR in System mode) (undefined, nop or assert)
maxSIMDUnroll	Uns32	If SIMD operations are supported, specify the maximum number of parallel SIMD operations to unroll (unrolled operations can be faster, but produce more verbose JIT code)
override_debugMask	Uns32	Specifies debug mask, enabling debug output for model components
ASIDCacheSize	Uns32	Specifies the number of different ASIDs for which TLB entries are cached; a value of 0 implies no limit
endian	Endian	Model endian
override_numCPUs	Uns32	Specify the number of cores in a multiprocessor (maximum of 8 for GICv1/GICv2)
override_affinityMask	Uns32	Specify bitmask of implemented affinity bits in format Aff3:Aff2:Aff1:Aff0 (each a byte)
override_MPIDR_MT	Boolean	Specifies that processor is multithreaded
override_MPIDR_Aff0	Uns32	Override Aff0 field in MPIDR/MPIDR_EL1 register
override_MPIDR_Aff1	Uns32	Override Aff1 field in MPIDR/MPIDR_EL1 register (also possible by writing CLUSTERIDAFF1 configuration net)

override_MPIDR_Aff2	Uns32	Override Aff2 field in MPIDR/MPIDR_EL1 register (also possible by writing CLUSTERIDAFF2 configuration net)
override_MPIDR_Aff3	Uns32	Override Aff3 field in MPIDR_EL1 register (also possible by writing CLUSTERIDAFF3 configuration net)
override_fcsePresent	Boolean	Specifies that FCSE is present (if true)
override_fpexcDexPresent	Boolean	Specifies that the FPEXC.DEX register field is implemented (if true)
override_advSIMDPresent	Boolean	Specifies that Advanced SIMD extensions are present (if true)
override_vfpPresent	Boolean	Specifies that VFP extensions are present (if true)
override_physicalBits	Uns32	Specifies the implemented physical bus bits (defaults to connected physical bus width)
override_timerScaleFactor	Uns32	Specifies the fraction of MIPS rate to use for MPCore timers (generic timers or global/local/watchdogs depending on implementation). Defaults to 20 for generic timers, 2 for others
override_GICD_NSACRPresent	Boolean	Specifies that optional GICD_NSACR distributor registers are present (GICv2 only)
override_GICD_PPISRPresent	Boolean	Specifies that implementation-specific GICD_PPISR distributor register is present (GICv1 ICDPPIS/ICPPISR, GICv1 and GICv2 only)
override_GICD_SPISRPresent	Boolean	Specifies that implementation-specific GICD_SPISR distributor registers are present (GICv1 ICDSPIS/ICSPISR)
override_GIC_PPIMask	Uns32	Specify bitmask of implemented PPIs in the GIC (e.g. ID16 is 0x0001, ID31 is 0x8000)
override_GICCDISABLE	Boolean	Specify initial value of GICCDISABLE
override_SCTLR_V	Boolean	Override SCTLR.V with the passed value (enables high vectors; also configurable using VINITHI pin)
override_SCTLR_IE	Boolean	Override SCTLR.IE with the passed value (configures instruction endianness; also configurable using CFGIE pin)
override_SCTLR_EE	Boolean	Override SCTLR.EE with the passed value (configures exception data endianness; also configurable using CFGEE pin)
override_SCTLR_TE	Boolean	Override SCTLR.TE with the passed value (configures Thumb state for exception handling; also configurable using TEINIT pin)
override_SCTLR_NMFI	Boolean	Override SCTLR.NMFI with the passed value (configures NMFI state for exception handling; also configurable using CFGNMFI pin)
override_SCTLR_CP15BEN_Present	Boolean	Enable ARMv7 SCTLR.CP15BEN bit (CP15 barrier enable)
override_MIDR	Uns32	Override MIDR/MIDR_EL1 register
override_CTR	Uns32	Override CTR/CTR_EL0 register
override_TLBTR	Uns32	Override TLBTR register
override_CLIDR	Uns32	Override CLIDR/CLIDR_EL1 register
override_AIDR	Uns32	Override AIDR/AIDR_EL1 register
override_CBAR	Uns32	Override Configuration Base Address Register (Corresponds to value on PERIPHBASE input pins)
override_PFR0	Uns32	Override ID_PFR0/ID_PFR0_EL1 register
override_PFR1	Uns32	Override ID_PFR1/ID_PFR1_EL1 register
override_DFR0	Uns32	Override ID_DFR0/ID_DFR0_EL1 register
override_AFR0	Uns32	Override ID_AFR0/ID_AFR0_EL1 register
override_MMFR0	Uns32	Override ID_MMFR0/ID_MMFR0_EL1 register
override_MMFR1	Uns32	Override ID_MMFR1/ID_MMFR1_EL1 register
override_MMFR2	Uns32	Override ID_MMFR2/ID_MMFR2_EL1 register
override_MMFR3	Uns32	Override ID_MMFR3/ID_MMFR3_EL1 register

override.ISAR0	Uns32	Override ID_ISAR0/ID_ISAR0_EL1 register
override.ISAR1	Uns32	Override ID_ISAR1/ID_ISAR1_EL1 register
override.ISAR2	Uns32	Override ID_ISAR2/ID_ISAR2_EL1 register
override.ISAR3	Uns32	Override ID_ISAR3/ID_ISAR3_EL1 register
override.ISAR4	Uns32	Override ID_ISAR4/ID_ISAR4_EL1 register
override.ISAR5	Uns32	Override ID_ISAR5/ID_ISAR5_EL1 register
override.PMCR	Uns32	Override PMCR/PMCR_EL0 register (not functionally significant in the model)
override.PMCEID0	Uns64	Override PMCEID0/PMCEID0_EL0 register (not functionally significant in the model)
override.PMCEID1	Uns64	Override PMCEID1/PMCEID1_EL0 register (not functionally significant in the model)
override.DBGDIDR	Uns32	Override DBGDIDR register (not functionally significant in the model)
override.FPSID	Uns32	Override SIMD/VFP FPSID register
override.MVFR0	Uns32	Override SIMD/VFP MVFR0/MVFR0_EL1 register
override.MVFR1	Uns32	Override SIMD/VFP MVFR1/MVFR1_EL1 register
override.FPEXC	Uns32	Override SIMD/VFP FPEXC/FPEXC32_EL2 register
override.GICC_IIDR	Uns32	Override GICC_IIDR register (GICv1 ICCIHDR)
override.GICD_TYPER	Uns32	Override GICD_TYPER register (GICv1 ICDICTR)
override.GICD_TYPER_ITLines	Uns32	Override ITLinesNumber field of GICD_TYPER register (GICv1 ICDICTR)
override.GICD_ICFGRN	Uns32	Override reset value of GICD_ICFGR2...GICD_ICFGRn (GICv1 ICDICFR2...ICDICFRn)
override.GICD_IIDR	Uns32	Override GICD_IIDR register (GICv1 ICDIHDR)
override.GICH_VTR	Uns32	Override GICH_VTR register
override.ICCPMRBits	Uns32	Specify the number of writable bits in GICC_PMR (GICv1 ICCPMR)
override.minICCBPR	Uns32	Specify the minimum possible value for GICC_BPR (GICv1 ICCBPR)
override.ERG	Uns32	Specifies exclusive reservation granule
override.CCSIDR_1I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 1 instruction)
override.CCSIDR_1D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 1 data)
override.CCSIDR_2I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 2 instruction)
override.CCSIDR_2D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 2 data)
override.CCSIDR_3I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 3 instruction)
override.CCSIDR_3D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 3 data)
override.CCSIDR_4I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 4 instruction)
override.CCSIDR_4D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 4 data)
override.CCSIDR_5I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 5 instruction)
override.CCSIDR_5D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 5 data)
override.CCSIDR_6I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 6 instruction)
override.CCSIDR_6D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 6 data)
override.CCSIDR_7I	Uns32	Override CCSIDR/CCSIDR_EL1 (level 7 instruction)
override.CCSIDR_7D	Uns32	Override CCSIDR/CCSIDR_EL1 (level 7 data)
override.STRoffsetPC12	Boolean	Specifies that STR/STR of PC should do so with 12:byte offset from the current instruction (if true), otherwise an 8:byte offset is used
override.fcseRequiresMMU	Boolean	Specifies that FCSE is active only when MMU is enabled (if true)
override.ignoreBadCp15	Boolean	Specifies whether invalid coprocessor 15 access should be ignored (if true) or cause Invalid Instruction exceptions (if false)
override.SGIDisable	Boolean	Override whether GIC SGIs may be disabled (if true) or are permanently enabled (if false)

override_condUndefined	Boolean	Force undefined instructions to take Undefined Instruction exception even if they are conditional
override_deviceStrongAligned	Boolean	Force accesses to Device and Strongly Ordered regions to be aligned
override_Control_V	Boolean	Override SCTL.R.V with the passed value (deprecated, use override_SCTL.R.V)
override_MainId	Uns32	Override MIDR register (deprecated, use override_MIDR)
override_CacheType	Uns32	Override CTR register (deprecated, use override_CTR)
override_TLBType	Uns32	Override TLBTR register (deprecated, use override_TLBTR)
override_InstructionAttributes0	Uns32	Override ID_ISAR0 register (deprecated, use override_ISAR0)
override_InstructionAttributes1	Uns32	Override ID_ISAR1 register (deprecated, use override_ISAR1)
override_InstructionAttributes2	Uns32	Override ID_ISAR2 register (deprecated, use override_ISAR2)
override_InstructionAttributes3	Uns32	Override ID_ISAR3 register (deprecated, use override_ISAR3)
override_InstructionAttributes4	Uns32	Override ID_ISAR4 register (deprecated, use override_ISAR4)
override_InstructionAttributes5	Uns32	Override ID_ISAR5 register (deprecated, use override_ISAR5)

Table 8.1: Parameters that can be set in: MPCORE

## Chapter 9

# Execution Modes

Mode	Code
User	16
FIQ	17
IRQ	18
Supervisor	19
Monitor	22
Abort	23
Undefined	27
System	31

Table 9.1: Modes implemented in: CPU

## Chapter 10

# Exceptions

<b>Exception</b>	Code
Reset	0
Undefined	1
SupervisorCall	2
SecureMonitorCall	3
PrefetchAbort	5
DataAbort	6
IRQ	8
FIQ	9

Table 10.1: Exceptions implemented in: CPU

# Chapter 11

## Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

### 11.1 Level 1: MPCORE

This level in the model hierarchy has 2 commands.

This level in the model hierarchy has no register groups.

This level in the model hierarchy has one child:

CPU0

### 11.2 Level 2: CPU

This level in the model hierarchy has 5 commands.

This level in the model hierarchy has 20 register groups:

Group name	Registers
Core	16
Control	3
User	7
FIQ	8
IRQ	3
Supervisor	3
Monitor	3
Undefined	3
Abort	3
SIMD_VFP	32
SIMD_VFP_SYS	5
Coprocessor_32_bit	122

Coprocessor_32_bit_secure	20
Coprocessor_32_bit_non_secure	20
Integration_support	27
MPCore_SCR	8
MPCore_distributor	91
MPCore_processor_interface	9
MPCore_timer_and_watchdog	10
MPCore_global_timer	5

Table 11.1: Register groups

This level in the model hierarchy has no children.

# Chapter 12

## Model Commands

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

### 12.1 Level 1: MPCORE

#### 12.1.1 isync

specify instruction address range for synchronous execution

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

Table 12.1: isync command arguments

#### 12.1.2 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-instructioncount	Boolean	include the instruction number in each trace
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.2: itrace command arguments

### 12.2 Level 2: CPU

#### 12.2.1 debugflags

show or modify the processor debug flags

Argument	Type	Description
-get	Boolean	print current processor flags value
-mask	Boolean	print valid debug flag bits
-set	Int32	new processor flags (only flags 0x000003e4 can be modified)

Table 12.3: debugflags command arguments

### 12.2.2 dumpTLB

report TLB contents

Argument	Type	Description
-all	Boolean	show the contents of all TLBs (if False, show just the current TLB)

Table 12.4: dumpTLB command arguments

### 12.2.3 isync

specify instruction address range for synchronous execution

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

Table 12.5: isync command arguments

### 12.2.4 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-instructioncount	Boolean	include the instruction number in each trace
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.6: itrace command arguments

### 12.2.5 validateTLB

check TLB contents against page tables in memory and report incoherent entries

Argument	Type	Description
----------	------	-------------

-all	Boolean	check all TLBs (if False, validate just the current TLB)
-verbose	Boolean	show all TLB entries (if False, show only incoherent entries)

Table 12.7: validateTLB command arguments

# Chapter 13

## Registers

### 13.1 Level 1: MPCORE

No registers.

### 13.2 Level 2: CPU

#### 13.2.1 Core

Registers at level:2, type:CPU group:Core

Name	Bits	Initial-Hex	RW	Description
r0	32	0	rw	
r1	32	0	rw	
r2	32	0	rw	
r3	32	0	rw	
r4	32	0	rw	
r5	32	0	rw	
r6	32	0	rw	
r7	32	0	rw	
r8	32	0	rw	
r9	32	0	rw	
r10	32	0	rw	
r11	32	0	rw	frame pointer
r12	32	0	rw	
sp	32	0	rw	stack pointer
lr	32	0	rw	
pc	32	0	rw	program counter

Table 13.1: Registers at level 2, type:CPU group:Core

#### 13.2.2 Control

Registers at level:2, type:CPU group:Control

Name	Bits	Initial-Hex	RW	Description
fps	32	0	rw	archaic FPSCR view (for gdb)
cpsr	32	1d3	rw	
spsr	32	0	rw	

Table 13.2: Registers at level 2, type:CPU group:Control

### 13.2.3 User

Registers at level:2, type:CPU group:User

Name	Bits	Initial-Hex	RW	Description
r8_usr	32	0	rw	
r9_usr	32	0	rw	
r10_usr	32	0	rw	
r11_usr	32	0	rw	
r12_usr	32	0	rw	
sp_usr	32	0	rw	
lr_usr	32	0	rw	

Table 13.3: Registers at level 2, type:CPU group:User

### 13.2.4 FIQ

Registers at level:2, type:CPU group:FIQ

Name	Bits	Initial-Hex	RW	Description
r8_fiq	32	0	rw	
r9_fiq	32	0	rw	
r10_fiq	32	0	rw	
r11_fiq	32	0	rw	
r12_fiq	32	0	rw	
sp_fiq	32	0	rw	
lr_fiq	32	0	rw	
spsr_fiq	32	0	rw	

Table 13.4: Registers at level 2, type:CPU group:FIQ

### 13.2.5 IRQ

Registers at level:2, type:CPU group:IRQ

Name	Bits	Initial-Hex	RW	Description
sp_irq	32	0	rw	
lr_irq	32	0	rw	
spsr_irq	32	0	rw	

Table 13.5: Registers at level 2, type:CPU group:IRQ

### 13.2.6 Supervisor

Registers at level:2, type:CPU group:Supervisor

Name	Bits	Initial-Hex	RW	Description
sp_svc	32	0	rw	
lr_svc	32	0	rw	
spsr_svc	32	0	rw	

Table 13.6: Registers at level 2, type:CPU group:Supervisor

### 13.2.7 Monitor

Registers at level:2, type:CPU group:Monitor

Name	Bits	Initial-Hex	RW	Description
sp_mon	32	0	rw	
lr_mon	32	0	rw	
spsr_mon	32	0	rw	

Table 13.7: Registers at level 2, type:CPU group:Monitor

### 13.2.8 Undefined

Registers at level:2, type:CPU group:Undefined

Name	Bits	Initial-Hex	RW	Description
sp_undef	32	0	rw	
lr_undef	32	0	rw	
spsr_undef	32	0	rw	

Table 13.8: Registers at level 2, type:CPU group:Undefined

### 13.2.9 Abort

Registers at level:2, type:CPU group:Abort

Name	Bits	Initial-Hex	RW	Description
sp_abt	32	0	rw	
lr_abt	32	0	rw	
spsr_abt	32	0	rw	

Table 13.9: Registers at level 2, type:CPU group:Abort

### 13.2.10 SIMD\_VFP

Registers at level:2, type:CPU group:SIMD\_VFP

Name	Bits	Initial-Hex	RW	Description
d0	64	0	rw	
d1	64	0	rw	
d2	64	0	rw	
d3	64	0	rw	
d4	64	0	rw	
d5	64	0	rw	
d6	64	0	rw	
d7	64	0	rw	
d8	64	0	rw	
d9	64	0	rw	
d10	64	0	rw	
d11	64	0	rw	
d12	64	0	rw	
d13	64	0	rw	
d14	64	0	rw	
d15	64	0	rw	
d16	64	0	rw	
d17	64	0	rw	
d18	64	0	rw	
d19	64	0	rw	
d20	64	0	rw	

d21	64	0	rw	
d22	64	0	rw	
d23	64	0	rw	
d24	64	0	rw	
d25	64	0	rw	
d26	64	0	rw	
d27	64	0	rw	
d28	64	0	rw	
d29	64	0	rw	
d30	64	0	rw	
d31	64	0	rw	

Table 13.10: Registers at level 2, type:CPU group:SIMD\_VFP

### 13.2.11 SIMD\_VFP\_SYS

Registers at level:2, type:CPU group:SIMD\_VFP\_SYS

Name	Bits	Initial-Hex	RW	Description
FPSID	32	41033092	r-	floating-point system ID
FPSCR	32	0	rw	floating-point status/control
FPEXC	32	0	rw	floating-point exception
MVFR0	32	10110222	r-	Media/VFP feature 0
MVFR1	32	11111111	r-	Media/VFP feature 1

Table 13.11: Registers at level 2, type:CPU group:SIMD\_VFP\_SYS

### 13.2.12 Coprocessor\_32\_bit

Registers at level:2, type:CPU group:Coprocessor\_32\_bit

Name	Bits	Initial-Hex	RW	Description
ACTLR	32	0	rw	Auxiliary Control
ADFSR	32	0	rw	Auxiliary Data Fault Status
AIDR	32	0	r-	Auxiliary ID
AIFSR	32	0	rw	Auxiliary Instruction Fault Status
ATS1CPR	32	-	-w	Address Translate Stage 1 Current State EL1 Read
ATS1CPW	32	-	-w	Address Translate Stage 1 Current State EL1 Write
ATS1CUR	32	-	-w	Address Translate Stage 1 Current State Unprivileged Read
ATS1CUW	32	-	-w	Address Translate Stage 1 Current State Unprivileged Write
ATS12NSOPR	32	-	-w	Address Translate Stages 1 and 2 Non-Secure Only EL1 Read
ATS12NSOPW	32	-	-w	Address Translate Stages 1 and 2 Non-Secure Only EL1 Write
ATS12NSOUR	32	-	-w	Address Translate Stages 1 and 2 Non-Secure Only Unprivileged Read
ATS12NSOUW	32	-	-w	Address Translate Stages 1 and 2 Non-Secure Only Unprivileged Write
BPIALL	32	-	-w	Branch Predictor Invalidate All
BPIALLIS	32	-	-w	Branch Predictor Invalidate All (IS)
BPIMVA	32	-	-w	Branch Predictor Invalidate by VA
CBAR	32	13080000	rw	Configuration Base Address
CCSIDR	32	201fe019	r-	Cache Size ID
CLIDR	32	9200003	r-	Cache Level ID
CONTEXTIDR	32	0	rw	Context ID
CP15DMB	32	-	-w	CP15 Data Memory Barrier
CP15DSB	32	-	-w	CP15 Data Synchronization Barrier

CP15ISB	32	-	-w	CP15 Instruction Synchronization Barrier
CP15NOP	32	-	-w	CP15 NOP
CPACR	32	0	rw	Coprocessor Access Control
CSSELR	32	1	rw	Cache Size Selection
CTR	32	83338003	r-	Cache Type
DACR	32	0	rw	Domain Access Control
DBGDIDR	32	0	r-	Debug ID
DCCIMVAC	32	-	-w	Data Cache Line Clean and Invalidate by VA to PoC
DCCISW	32	-	-w	Data Cache Line Clean and Invalidate by Set/Way
DCCMVAC	32	-	-w	Data Cache Line Clean by VA to PoC
DCCMVAU	32	-	-w	Data Cache Line Clean by VA to PoU
DCCSW	32	-	-w	Data Cache Line Clean by Set/Way
DCIMVAC	32	-	-w	Data Cache Line Invalidate by VA to PoC
DCISW	32	-	-w	Data Cache Line Invalidate by Set/Way
DFAR	32	0	rw	Data Fault Address
DFSR	32	0	rw	Data Fault Status

Table 13.14: Registers at level 2, type:CPU group:Coprocessor\_32\_bit\_non\_secure

### 13.2.15 Integration\_support

Registers at level:2, type:CPU group:Integration\_support

Name	Bits	Initial-Hex	RW	Description
transactPL	32	1	r-	privilege level of current memory transaction
transactAT	32	0	r-	current memory transaction type: PA=1, VA=0

artifactPAR	64	0	r-	result of address translation for artifact write to ATS1CPR etc
PTWBankValid	8	0	r-	bitmask of valid banks (0x01 is stage 1, 0x02 is stage 2, 0x04-0x20 are stage 2 walks initiated by stage 1 level 0-3 entry lookups, respectively)
PTWAddressValid	8	0	r-	bitmask of valid bits for each of PTWAddressL0...PTWAddressL3, PTWBase, PTWInput and PTWOutput in current bank
PTWAddressNS	8	0	r-	bitmask of Non-Secure bits for each of PTWAddressL0...PTWAddressL3, PTWBase and PTWOutput in current bank (PTWInput bit is always 0)
PTWValueValid	8	0	r-	bitmask of valid bits for each of PTWValueL0...PTWValueL3 in current bank
PTWAddressL0	64	0	r-	current bank PTW address, level 0
PTWAddressL1	64	0	r-	current bank PTW address, level 1
PTWAddressL2	64	0	r-	current bank PTW address, level 2
PTWAddressL3	64	0	r-	current bank PTW address, level 3
PTWValueL0	64	0	r-	current bank PTW value, level 0
PTWValueL1	64	0	r-	current bank PTW value, level 1
PTWValueL2	64	0	r-	current bank PTW value, level 2
PTWValueL3	64	0	r-	current bank PTW value, level 3
PTWBase	64	0	r-	current bank PTW table base address
PTWInput	64	0	r-	current bank PTW input address
PTWOutput	64	0	r-	current bank PTW output address
PTWPgSize	64	0	r-	current bank PTW page size (Valid only when PTWOutput is valid)
PTWLEL1S	64	-	-w	perform EL1(S) stage 1 page table walk for fetch, filling PTW query registers
PTWD_EL1S	64	-	-w	perform EL1(S) stage 1 page table walk for load/store, filling PTW query registers
PTWLEL1NS	64	-	-w	perform EL1(NS) stage 1 page table walk for fetch, filling PTW query registers
PTWD_EL1NS	64	-	-w	perform EL1(NS) stage 1 page table walk for load/store, filling PTW query registers
PTWL_current	64	-	-w	perform current mode page table walk for fetch, filling PTW query registers
PTWD_current	64	-	-w	perform current mode page table walk for load/store, filling PTW query registers
ResetTLBs	8	-	-w	reset all implemented TLBs to initial state
HaltReason	8	0	r-	bit field indicating halt reason

Table 13.15: Registers at level 2, type:CPU group:Integration\_support

### 13.2.16 MPCore\_SCR

Registers at level:2, type:CPU group:MPCore\_SCR

Name	Bits	Initial-Hex	RW	Description
SCUCPUPowerStatus	32	3030300	rw	SCU CPU Power Status
SCUConfiguration	32	100	r-	SCU Configuration
SCUControl	32	0	rw	SCU Control
SCUFilteringEnd	32	0	rw	SCU Filtering End
SCUFilteringStart	32	0	rw	SCU Filtering Start
SCUInvalidateSecure	32	0	-w	SCU Invalidate Secure
SCUNSAC	32	0	rw	SCU Non-secure Access Control
SCUSAC	32	f	rw	SCU Secure Access Control

Table 13.16: Registers at level 2, type:CPU group:MPCore\_SCR

**13.2.17 MPCore\_distributor**

Registers at level:2, type:CPU group:MPCore\_distributor

Name	Bits	Initial-Hex	RW	Description
ICCIDR0	32	d	r-	Component ID 0
ICCIDR1	32	f0	r-	Component ID 1
ICCIDR2	32	5	r-	Component ID 2
ICCIDR3	32	b1	r-	Component ID 3
ICDABR0	32	0	rw	Interrupt Set-Active 0
ICDABR1	32	0	rw	Interrupt Set-Active 1
ICDABR2	32	0	rw	Interrupt Set-Active 2
ICDDCR	32	0	rw	Distributor Control
ICDICER0	32	fff	rw	Interrupt Clear-Enable 0
ICDICER1	32	0	rw	Interrupt Clear-Enable 1
ICDICER2	32	0	rw	Interrupt Clear-Enable 2

Table 13.17: Registers at level 2, type:CPU group:MPCore\_distributor

### 13.2.18 MPCore\_processor\_interface

Registers at level:2, type:CPU group:MPCore\_processor\_interface

Name	Bits	Initial-Hex	RW	Description
ICCABPR	32	3	rw	Aliased Binary Point
ICCBPR	32	2	rw	Binary Point
ICCEOIR	32	0	-w	End of Interrupt
ICCHPIR	32	3ff	r-	Highest Priority Pending Interrupt
ICCIAR	32	3ff	r-	Interrupt Acknowledge
ICCICR	32	0	rw	CPU Interface Control
ICCIIDR	32	3901243b	r-	CPU Interface ID
ICCPMR	32	0	rw	Interrupt Priority Mask
ICCRPR	32	ff	r-	Running Priority

Table 13.18: Registers at level 2, type:CPU group:MPCore\_processor\_interface

### 13.2.19 MPCore\_timer\_and\_watchdog

Registers at level:2, type:CPU group:MPCore\_timer\_and\_watchdog

Name	Bits	Initial-Hex	RW	Description
PTControl	32	0	rw	Private Timer Control
PTCounter	32	0	rw	Private Timer Counter
PTInterruptStatus	32	0	rw	Private Timer Interrupt Status
PTLoad	32	0	rw	Private Timer Load
WTControl	32	0	rw	Watchdog Timer Control
WTCounter	32	0	rw	Watchdog Timer Counter
WTDisable	32	0	-w	Watchdog Timer Disable
WTInterruptStatus	32	0	rw	Watchdog Timer Interrupt Status
WTLoad	32	0	rw	Watchdog Timer Load
WTResetStatus	32	0	rw	Watchdog Timer Reset Status

Table 13.19: Registers at level 2, type:CPU group:MPCore\_timer\_and\_watchdog

### 13.2.20 MPCore\_global\_timer

Registers at level:2, type:CPU group:MPCore\_global\_timer

Name	Bits	Initial-Hex	RW	Description
GTAutoIncrement	32	0	rw	Global Timer Auto-Increment
GTComparator	64	0	rw	Global Timer Comparator
GTControl	32	0	rw	Global Timer Control
GTCounter	64	0	rw	Global Timer Counter
GTInterruptStatus	32	0	rw	Global Timer Interrupt Status

Table 13.20: Registers at level 2, type:CPU group:MPCore\_global\_timer
